>5 yr	<i>S. pneumoniae</i> <i>H. influenzae</i> <i>S. aureus</i>	Influenza Varicella Adenovirus	<i>Mycoplasma pneumoniae</i> <i>Chlamydia pneumoniae</i> TB <i>Legionella pneumophila</i>	Erythromycin OR clarithromycin (1st line) OR ampicillin OR cefuroxime

Bronchiolitis

Definition

- LRTI, usually in children <2 yr, that has wheezing and signs of respiratory distress

Epidemiology

- the most common LRTI in infants, affects 50% of children in first 2 yr of life; peak incidence at 6 mo, winter or early spring
- increased incidence of asthma in later life

Etiology

- RSV (>50%), parainfluenza, influenza, rhinovirus, adenovirus, *M. pneumoniae* (rare)

Clinical Presentation

- prodrome of URTI with cough and/or rhinorrhea, possible fever
- feeding difficulties, irritability
- wheezing, crackles, respiratory distress, tachypnea, tachycardia, retractions, poor air entry; symptoms often peak at 3-4 d

Bronchodilators for Bronchiolitis

Cochrane DB Syst Rev 2010;12:CD001266

Study: Meta-analysis of prospective, randomized, double-blinded, placebo-controlled trials.

Patients: 1,912 infants (28 trials) up to 24 mo old with bronchiolitis.

Intervention: Bronchodilators (including albuterol, salbutamol, terbutaline, ipratropium bromide, and adrenergic agents) given oral, subcutaneous, or nebulized vs. placebo.

Main Outcome: Oxygen saturation.

Results: No clinically significant difference for infants treated with bronchodilators vs. placebo for bronchiolitis. Given the costs and side effects, it is not recommended to use bronchodilators as management for bronchiolitis in infants.

Investigations

- CXR (only in severe disease, poor response to therapy, chronic episode): air trapping, peribronchial thickening, atelectasis, increased linear markings
- NP swab: direct detection of viral antigen (immunofluorescence)
- WBC can be normal

Treatment

- self-limiting disease with peak symptoms usually lasting 2-3 wk
- mild to moderate distress
 - supportive: PO or IV hydration, antipyretics for fever, regular or humidified high flow O₂
- severe distress
 - as above ± intubation and ventilation as needed
 - consider rebetol (Ribavirin*) in high risk groups: bronchopulmonary dysplasia, CHD, congenital lung disease, immunodeficient
- monthly RSV-Ig or palivizumab (monoclonal antibody against the F-glycoprotein of RSV) is protective against severe disease in high risk groups; case fatality rate <1%
- antibiotics have no therapeutic value unless there is secondary bacterial pneumonia
- indications for hospitalization
 - hypoxia: O₂ saturation <92% on initial presentation
 - persistent resting tachypnea >60/min and retractions after several salbutamol masks
 - past history of chronic lung disease, hemodynamically significant cardiac disease, neuromuscular problem, immunocompromised
 - young infants <6 mo old (unless extremely mild)
 - significant feeding problems
 - social problem (e.g. inadequate care at home)

Children with bronchiolitis do not respond to ipratropium bromide (Atrovent®) or steroids

Asthma

Definition

- see [Respirology](#), R7
- characterized by recurrent episodes of airway hyperreactivity, bronchospasm, and inflammation; reversible small airway obstruction
- very common, presents most often in early childhood
- associated with other atopic diseases such as allergic rhinitis or atopic dermatitis

Clinical Presentation

- episodic bouts of wheezing, dyspnea, tachypnea, cough (usually at night/early morning, with activity, or cold exposure)
- physical exam may reveal hyper-resonant chest, prolonged expiration, wheeze

Triggers

- URTI (viral or *Mycoplasma*), weather (cold exposure, humidity changes), allergens (pets), irritants (cigarette smoke), exercise, emotional stress, drugs (ASA, β-blockers)

Classification

- mild: occasional attacks of wheezing or coughing (<2/wk); symptoms respond quickly to inhaled bronchodilator; never needs systemic corticosteroids
- moderate: more frequent episodes with symptoms persisting and chronic cough; decreased exercise tolerance; sometimes needs systemic corticosteroids
- severe: daily and nocturnal symptoms; frequent ED visits and hospitalizations; usually needs systemic corticosteroids

Management

- acute
 - O₂ (keep O₂ saturation >94%) and fluids if dehydrated
 - β₂-agonists: salbutamol (Ventolin*) MDI + spacer (nebulized or IV in very severe episodes with impending respiratory failure), 5 puffs (<20 kg) or 10 puffs q20min for first hour (>20 kg)
 - ipratropium bromide (Atrovent*) if severe: MDI + spacer, 3 puffs (<20 kg) or 6 puffs (>20 kg) q20min with salbutamol, or add to first 3 salbutamol masks (0.25 mg if <20 kg, 0.5mg if >20 kg)
 - steroids: prednisone (1-2 mg/kg x 5 d) or dexamethasone (0.3 mg/kg/d x 5 d or 0.6 mg/kg/d x 2 d); in severe disease, use IV steroids
 - continue to observe; can discharge patient if asymptomatic for 2-4 h after last dose
- chronic
 - education, emotional support, avoid allergens or irritants, develop an "action plan"
 - exercise program (e.g. swimming)
 - monitor respiratory function with peak flow meter (improves self-awareness of status)

Canadian Pediatric Asthma Consensus Guidelines for Assessing Adequate Control of Asthma

- Daytime symptoms <4 d/wk
- Night time symptoms <1 night/wk
- Normal physical activity
- Mild and infrequent exacerbations
- No work/school absenteeism
- Need for β-agonist <4 doses/wk
- FEV₁ or peak expiratory flow ≥90% of personal best
- Peak expiratory flow diurnal variation <10-15%

- PFTs for children >6 yr
- reliever therapy: short acting β_2 -agonists (e.g. salbutamol)
- controller therapy (first line therapy for all children): low dose daily inhaled corticosteroids
- second line therapy for children <12 yr: moderate dose of daily inhaled corticosteroids
- second line therapy for children >12 yr: leukotriene receptor antagonist OR long acting β_2 -agonist in conjunction with low dose inhaled corticosteroids; leukotriene receptor antagonist monotherapy may be considered an alternative second line therapy
- severe asthma unresponsive to first and second line treatments: injection immunotherapy
- aerochamber for children using daily inhaled corticosteroids
- indications for hospitalization
 - ongoing need for supplemental O_2
 - persistently increased work of breathing
 - β_2 -agonists are needed more often than q4h after 4-8 h of conventional treatment
 - patient deteriorates while on systemic steroids

Cystic Fibrosis

- see [Respirology](#), R12

Etiology

- 1 per 3,000 live births, mostly Caucasians
- autosomal recessive, *CFTR* gene found on chromosome 7 ($\Delta F508$ mutation in 70%, but >1,600 different mutations identified) resulting in a dysfunctional chloride channel on the apical membrane of cells
- leads to relative dehydration of airway secretions, resulting in impaired mucociliary transport and airway obstruction

Clinical Presentation

- neonatal: meconium ileus, prolonged jaundice, antenatal bowel perforation
- infancy: pancreatic insufficiency with steatorrhea and FTT (despite voracious appetite), anemia, hypoproteinemia, hyponatremia
- childhood: heat intolerance, wheezing or chronic cough, recurrent chest infections (*S. aureus*, *P. aeruginosa*, *H. influenzae*), hemoptysis, nasal polyps, distal intestinal obstruction syndrome, rectal prolapse, clubbing of fingers
- older patients: COPD, infertility (males), decreased fertility (female)

Investigations

- sweat chloride test x 2 (>60 mEq/L)
 - false positive tests: malnutrition, atopic dermatitis, hypothyroidism, hypoparathyroidism, GSD, adrenal insufficiency, G6PD, Klinefelter syndrome, technical issues, autonomic dysfunction, familial cholestasis syndrome
 - false negative tests: technical problem with test, malnutrition, skin edema, mineralocorticoids

Management

- nutritional counselling: high calorie diet, pancreatic enzyme replacements, fat soluble vitamin supplements
- management of chest disease: physiotherapy, postural drainage, exercise, bronchodilators, aerosolized DNAase and inhaled hypertonic saline, antibiotics (e.g. cephalosporin, cloxacillin, ciprofloxacin, inhaled tobramycin depending on sputum C&S), lung transplantation
- genetic counselling

Complications

- respiratory failure, pneumothorax (poor prognostic sign), cor pulmonale (late), pancreatic fibrosis with DM, gallstones, cirrhosis with portal HTN, infertility (male)
- early death (current median survival in Canada is 46.6 yr)

CF Presenting Signs

CF PANCREAS

Chronic cough and wheezing
FTT

Pancreatic insufficiency (symptoms of malabsorption such as steatorrhea)

Alkalosis and hypotonic dehydration

Neonatal intestinal obstruction

(meconium ileus)/Nasal polyps

Clubbing of fingers/Chest radiograph

with characteristic changes

Rectal prolapse

Electrolyte elevation in sweat, salty skin

Absence or congenital atresia of vas

deferens

Sputum with *S. aureus* or *P. aeruginosa*

(mucoid)

- Pancreatic dysfunction – determined

- by 3 d fecal fat collection

- Genetics – useful where sweat

- chloride test is equivocal

Rheumatology

Evaluation of Limb Pain

Table 46. Differential Diagnosis of Limb Pain

Cause	<3 yr	3-10 yr	>10 yr
Trauma	X	X	X
Infectious			
Septic arthritis	X	X	X
Osteomyelitis	X	X	X
Inflammatory			
Transient synovitis	X	X	
JIA	X	X	X
Spondyloarthritis		X	X
SLE		X	X
Dermatomyositis		X	X
HSP		X	X
Anatomic/Orthopedic			
Legg-Calvé-Perthes disease		X	X
Slipped capital femoral epiphysis			X
Osgood-Schlatter disease			X
Neoplastic			
Leukemia	X	X	X
Neuroblastoma	X	X	X
Bone tumour		X	X
Hematologic			
Hemophilia (hemarthrosis)	X	X	X
Sickle cell anemia	X	X	X
Pain Syndromes			
Growing pains		X	X
Fibromyalgia		X	X
Complex regional pain syndrome			X

- must rule out infection, malignancy, and acute orthopedic conditions

History

- demographics (age, gender)
- pattern of onset and progression of symptoms (including acuity and chronicity)
- morning stiffness, limp/weight-bearing status, night pain
- joint involvement (type, distribution) ± spine (axial) involvement
- extra-articular manifestations and systemic symptoms
- functional status – activities of daily living
- family history (arthritis, IBD, psoriasis, spondyloarthropathies, uveitis, bleeding disorders, sickle cell anemia)
- past medical illness, intercurrent infection, travel, sick contact history, joint injury

Physical Exam

- growth parameters
- screening examination (pediatric gait, arms, legs, spine exam)
- joint exam: inspection/palpation (swelling, erythema, warmth, tenderness, deformity), ROM
- adjacent structures (bone, tendon, muscle, skin)
- leg length
- neurologic exam

Investigations

- basic: CBC and differential, blood smear, ESR, CRP, x-ray
- as indicated: blood (ANA, RF, culture, viral/bacterial serology, CK, PTT, sickle cell screen, immunoglobulins, complement), urinalysis, synovial fluid (cell count, Gram stain, culture), TB skin test, imaging, bone marrow aspiration, slit lamp exam

Red Flags for Limb Pain

Fever, pinpoint pain/tenderness, pain out of proportion to degree of inflammation, night pain, weight loss, erythema

Growing Pains

Epidemiology

- age 2-12 yr, M=F

Clinical Presentation

- diagnosis of exclusion
- intermittent, non-articular pain in childhood with *normal physical exam findings*
- pain at night, often bilateral and limited to the calf, shin, or thigh; typically short-lived
- relieved by heat, massage, mild analgesics
- child is well, asymptomatic during the day, no functional limitation
- possible family history of growing pains

Management

- lab investigations not necessary if typical presentation; reassurance and supportive management

Transient Synovitis of the Hip

- benign, self-limited disorder, usually occurs after URTI, pharyngitis, AOM

Epidemiology

- age 3-10 yr, M>F

Clinical Presentation

- afebrile or low-grade fever, pain typically occurs in hips, knees (referred from hip); painful limp but full ROM (pain not as pronounced as in joint or bone infections)
- symptoms resolve over 7-10 d

Investigations

- WBC within normal limits; ESR and CRP may be mildly elevated
- joint effusions may be seen on imaging
- diagnosis of exclusion (rule out septic arthritis and osteomyelitis)

Treatment

- symptomatic and anti-inflammatory medications

Septic Arthritis and Osteomyelitis

- MEDICAL EMERGENCY
- see [Orthopedics](#), OR10

Table 47. Microorganisms and Treatment Involved in Septic Arthritis/Osteomyelitis

Age	Pathogens	Treatment
Neonate	GBS, <i>S. aureus</i> , Gram negative bacilli	cloxacillin + aminoglycoside or cefotaxime
Infant (1-3 mo)	<i>Strep. spp.</i> , <i>Staph. spp.</i> , <i>H. influenzae</i> Pathogens as per neonate	cloxacillin + cefotaxime
Child	<i>S. aureus</i> , <i>S. pneumoniae</i> , GAS	cefazolin
Adolescent	As above; also <i>N. gonorrhoeae</i>	cefazolin
Sickle cell disease	As above; also <i>Salmonella</i>	cefotaxime

GAS = group A Strep; GBS = group B Strep

Adapted from Tse SML, Laxer RM. *Pediatrics in Review* 2006;27:170-179

Juvenile Idiopathic Arthritis

- a heterogeneous group of conditions characterized by persistent arthritis in children <16 yr
- diagnosis: arthritis in ≥1 joint(s); duration ≥6 wk; onset age <16 yr old; exclusion of other causes of arthritis; classification defined by features/number of joints affected in the first 6 mo of onset

Systemic Arthritis (Still's Disease)

- onset at any age, M=F
- once or twice daily fever spikes (>38.5°C) ≥2 d/wk; children usually acutely unwell during fever episodes
- extra-articular features: erythematous "salmon-coloured" maculopapular rash, lymphadenopathy, hepatosplenomegaly, leukocytosis, thrombocytosis, anemia, serositis

- arthritis may occur weeks to months later
- high ESR, CRP, WBC, platelet count

Oligoarticular Arthritis (1-4 joints)

- onset early childhood, F>M
- persistent: affects no more than 4 joints during the disease course
- extended: affects more than 4 joints after the first 6 mo
- typically affects large joints: knees > ankles, elbows, wrists; hip involvement unusual
- ANA positive ~60-80%, RF negative
- screening eye exams for asymptomatic anterior uveitis (occurs in ~30%)
- complications: knee flexion contracture, quadriceps atrophy, leg-length discrepancy, growth disturbances

Polyarticular Arthritis (5 or more joints)

- RF negative
 - onset: 2-4 yr and 6-12 yr, F>M
 - symmetrical involvement of large and small joints of hands and feet, TMJ, cervical spine
- RF positive
 - onset: late childhood/early adolescence, F>M
 - similar to the aggressive form of adult rheumatoid arthritis
 - severe, rapidly destructive, symmetrical arthritis of large and small joints
 - may have rheumatoid nodules at pressure points (elbows, knees)
 - unremitting disease, persists into adulthood

Enthesitis-Related Arthritis

- onset: late childhood/adolescence, M>F
- arthritis and/or enthesitis (inflammation at the site where tendons or ligaments attach to the bone)
- weight bearing joints, especially hip and intertarsal joints
- risk of developing ankylosing spondylitis in adulthood

Psoriatic Arthritis

- onset: 2-4 yr and 9-11 yr, F>M
- arthritis and psoriasis OR arthritis and at least two of:
 - dactylitis, nail pitting or other abnormalities, or family history of psoriasis in a 1st degree relative
 - asymmetric or symmetric small or large joint involvement

Management

- goals of therapy: eliminate inflammation, prevent joint damage, promote normal growth and development as well as normal function, minimize medication toxicity
- exercise to maintain ROM and muscle strength
- multidisciplinary approach: OT/PT, social work, orthopedics, ophthalmology, rheumatology
- 1st line drug therapy: NSAIDs, intra-articular corticosteroids
- 2nd line drug therapy: DMARDs (methotrexate, sulfasalazine, leflunamide), corticosteroids (acute management of severe arthritis, systemic symptoms of JIA, topical eye drops for uveitis), biologic agents

Reactive Arthritis

- see [Rheumatology](#), RH24
- arthritis (typically the knee) follows bacterial infection, especially with *Salmonella*, *Shigella*, *Yersinia*, *Campylobacter*, *Chlamydia*, and most commonly *Streptococcus* (post-streptococcal reactive arthritis)
- typically resolves spontaneously
- may progress to chronic illness or Reiter's syndrome (urethritis, conjunctivitis)

Lyme Arthritis

- see [Infectious Diseases](#), ID23
- caused by spirochete *Borrelia burgdorferi*
- incidence highest among 5-10 yr olds
- do not treat children <8 yr old with doxycycline (may cause permanent tooth discolouration)

Systemic Lupus Erythematosus

- see [Rheumatology](#), RH11
- autoimmune illness affecting multiple organ systems
- incidence 1/1,000, more commonly age >10, F:M = 10:1
- childhood-onset SLE vs. adult-onset SLE: children have more active disease, are more likely to have renal disease, and children receive more intensive drug therapy and have a poorer prognosis

Vasculitides

HENOCH-SCHÖNLEIN PURPURA

- most common vasculitis of childhood, peak incidence 4-10 yr, M:F = 2:1
- vasculitis of small vessels
- often have history of URTI 1-3 wk before onset of symptoms

Clinical Presentation

- clinical tetrad: 1) palpable purpura, 2) abdominal pain, 3) arthritis
- skin: palpable, non-thrombocytopenic purpura in lower extremities and buttocks, edema, scrotal swelling
- joints: arthritis/arthralgia involving large joints associated with painful edema
- GI: abdominal pain, GI bleeding, intussusception
- renal: microscopic hematuria, IgA nephropathy, proteinuria, HTN, renal failure in <5%

Management

- mainly supportive
- anti-inflammatory medications for joint pain, corticosteroids for select patients
- monitor for protein on urinalysis every month for 6 mo, checking for renal disease, which may develop late (immunosuppressive therapy if severe)

Prognosis

- self-limited, resolves within 4 wk
- recurrence in about one-third of patients
- long-term prognosis dependent on severity of nephritis

KAWASAKI DISEASE

- acute vasculitis of unknown etiology (likely triggered by infection)
- medium-sized vasculitis with predilection for coronary arteries
- most common cause of acquired heart disease in children in developed countries
- peak age: 3 mo-5 yr; Asians > Blacks > Caucasians

Diagnostic Criteria

- fever persisting ≥ 5 d AND ≥ 4 of the following features
 1. bilateral, non-exudative conjunctival injection
 2. oral mucous membrane changes (fissured lips, strawberry tongue, injected pharynx)
 3. changes of the peripheral extremities
 - ♦ acute phase: extremity changes including edema of hands and feet or erythema of palms or soles
 - ♦ subacute phase: periungual desquamation
 4. polymorphous rash
 5. cervical lymphadenopathy >1.5 cm in diameter (usually unilateral)
- exclusion of other diseases (e.g. scarlet fever, measles)
- atypical Kawasaki disease: fever persisting ≥ 5 d and 2-3 of the above criteria
 - further evaluation dictated by CRP, ESR, and supplemental laboratory criteria

Diagnostic Criteria for Kawasaki Disease

Warm **CREAM**

Fever ≥ 5 d with ≥ 4 of:

Conjunctivitis

Rash

Edema/Erythema (hands and feet)

Adenopathy

Mucosal involvement

Management

- initial therapy: IVIG (2g/kg) and high (anti-inflammatory) dose of ASA
- once afebrile >48 hours: low (anti-platelet) dose of ASA until platelets normalize, or longer if coronary artery involvement
- IVIg within 10 d of onset reduces risk of coronary aneurysm formation
- baseline 2D-Echo and follow up periodic 2D-Echo (usually at 2, 6 wk)

Complications

- coronary artery vasculitis with aneurysm formation occurs in 20-25% of untreated children, <5% if receive IVIg within 10 d of fever
- 50% of aneurysms regress within 2 yr
- anticoagulation for multiple or large coronary aneurysms
- risk factors for coronary disease: male, age <1 or >9 yr, fever >10 d, Asian or Hispanic ethnicity, thrombocytopenia, hyponatremia

Common Medications

Table 48. Commonly Used Medications in Pediatrics

Drug Name	Dosing Schedule	Indications	Comments
acetaminophen (Tylenol®)	10-15 mg/kg/dose PO q4-6h prn	Analgesic, antipyretic	Not to exceed 60 mg/kg/d in neonates or 75 mg/kg/d in older children to a max of 4 g/d Causes hepatotoxicity at high doses
amoxicillin (Amoxil®)	80-90 mg/kg/d PO divided q8h	Otitis media	
dexamethasone	0.6 mg/kg PO x 1 0.6 mg/kg/d PO for 2 d	Croup Acute asthma	
fluticasone (Flovent®)	Moderate dose – 250-500 µg/d divided bid High dose – >500 µg/d divided bid	Asthma	
ibuprofen (Advil®)	5-10 mg/kg/dose PO q6-8h	Analgesic, antipyretic	Cautious use in patients with liver impairment, history of GI bleeding or ulcers
iron	6 mg/kg/d elemental iron OD or divided tid	Anemia	SE: dark stool, constipation, dark urine
omeprazole	0.7-3.3 mg/kg/d (max dose 20 mg/d) OD or divided bid/tid	GERD	SE: headache, diarrhea, nausea, abdominal pain
ondansetron	0.15 mg/kg/dose (max dose 16 mg) q4-8h up to 3x	Post-operative N/V Gastroenteritis Cyclic vomiting	SE: QTc prolongation, orally disintegrating tablets contain phenylalanine (caution in PKU patients)
phenobarbital	3-5 mg/kg/d PO OD or bid	Seizures	SE: CNS depression
polyethylene glycol 3350 (PEG)	Disimpaction: 1-1.5 g/kg/d x 3 d Maintenance: starting dose at 0.4-1 g/kg		
prednisone/ prednisolone	1-2 mg/kg/d PO x 5 d 3-4 mg/kg/d PO then taper to 1-2 mg/kg/d PO once platelet count >30 x 10 ⁹ /L 60 mg/m ² /d PO	Asthma ITP Nephrotic syndrome	Oral prednisone is bitter tasting, consider using prednisolone
salbutamol (Ventolin®)	0.01-0.03 mL/kg/dose in 3 mL NS via nebulizer q0.5-4h prn 100-200 µg/dose prn, max 4-8 puffs frequency q4h	Acute asthma Maintenance treatment for asthma	Can cause tachycardia, hypokalemia, restlessness

Skin Lesions and Masses

Differential Diagnosis of Skin Lesions/Masses

- for background information and medical management (see [Dermatology](#), D5)
- for biopsy techniques, see *Skin Biopsy Types and Techniques*, PL7

Surgical Management of Malignant Skin Lesions

- surgical treatment for all malignant skin lesions involve total excision of the primary lesion
- excision margin of lesion depends on the type of lesion, the lesion diameter and (for melanoma) the lesion depth
- for decisions regarding reconstruction using flaps or skin grafts, see *Reconstruction*, PL11

Precursors of Malignant Lesions

Table 1. Precursors

Basal Cell Carcinoma	Squamous Cell Carcinoma	Malignant Melanoma
Nevus sebaceous of Jadassohn	Actinic keratosis	Atypical mole
	Bowen's disease	Lentigo maligna
	Bowenoid papulosis	Giant congenital nevus
	Paget's disease	
	Leukoplakia	
	Erythroplasia	

Surgical Margins

Table 2. Surgical Margins for Basal Cell Carcinoma

Type of Lesion	Surgical Margins
Low Risk (<20 mm trunk; < 6 mm face, hands, feet)	4 mm
High Risk (>20 mm trunk; > 6 mm face, hands, feet)	10 mm

Table 3. Surgical Margins for Squamous Cell Carcinoma

Diameter or Location of Lesion	Surgical Margins
≤2 cm*	4 mm*
>2 cm	6 mm
High risk (facial)	6 mm
Low risk (elsewhere)	4 mm

*For a high risk lesion that is <2 cm in diameter, use a 6 mm margin

Table 4. Surgical Margins for Malignant Melanoma

Depth of Lesion	Surgical Margins
<i>In situ</i>	0.5 cm
<1 mm	1 cm
1.01-1.99 mm	1-2 cm
≥2 mm	At least 2 cm

Basic Surgical Techniques

Sutures and Suturing

ANESTHESIA

- irrigate before injecting anesthetic, followed by debridement

Table 5. Toxic Limit and Duration of Action (1 cc of 1% solution contains 10 mg lidocaine)

	Without Epinephrine	With Epinephrine (vasoconstrictor, limits bleeding)
Lidocaine (Xylocaine®)	5 mg/kg, lasts 45-60 min	7 mg/kg, lasts 2-6 h
Bupivacaine (Marcaine®) for longer analgesic effect	2 mg/kg, lasts 2-4 h	3 mg/kg, lasts 3-7 h

- example: if you have a 70 kg patient, the toxic limit for 1% lidocaine without epinephrine is
 - 5 mg x 70 kg = 350 mg TOXIC LIMIT
 - 350 mg ÷ 10 mg/cc = 35 cc MAX BOLUS INJECTION of 1% lidocaine without epinephrine (may add more after 30 min)

IRRIGATION AND DEBRIDEMENT

- irrigate copiously with a physiologic solution such as Ringer's lactate or normal saline to remove surface clots, foreign material, and bacteria
- use a 19 gauge needle and 35 cc syringe to generate ~18 psi when irrigating (~8 psi will reach the wound)
- debride all obviously devitalized tissue, irregular or ragged wounds must be excised to produce sharp wound edges that will assist healing when approximated
- wounds left unapproximated ≥8 h should be debrided to ensure wound edges are optimized for healing

SUTURES

- use of a particular suture material is highly dependent on surgeon preference; however, skin should be closed with a non absorbable material when traumatic mechanisms are involved
- suture materials are divided into absorbable vs. non-absorbable and monofilament vs. braided

Table 6. Suture Materials: Absorbable vs. Non-absorbable and Monofilament vs. Multifilament

Suture Materials	Uses	Examples	Notes
Absorbable	Deep sutures under short-term tension Skin closure in children	Plain gut®, Vicryl®, Polysorb®	loses at least 50% of their strength in 4 wk; eventually absorbed
Non-absorbable	Skin closure Sites of long-term tension	Nylon, polypropylene (Prolene), stainless steel	Lower likelihood of wound dehiscence, more difficult to tie
Monofilament	Everyday use and optimal for contaminated and infected wounds (lower likelihood of bacterial trapping in suture material)	Monosof®, Monocryl®, Biosyn®	Slides through tissue with less friction; more memory/stiffness
Multifilament	AVOID in contaminated wounds (increased likelihood of bacterial trapping)	Vicryl® and Silk	Less memory/stiffness thus easier to work with

BASIC SUTURING TECHNIQUES

Basic Suture Methods

- simple interrupted: can be used in almost all situations
- sub-cuticular: good cosmetic result but weak, used in combination with deep sutures; not used in trauma
- vertical mattress: for areas difficult to evert (e.g. dorsum of the hand)
- horizontal mattress: everting, time saving
- continuous over and over (i.e. "running", "baseball stitch"): time saving, good for hemostasis

Basic Principles

- minimize tissue trauma: follow curve of needle, insert and exit at 90 degrees to the wound edge, handle wound edges gently (use toothed forceps), use just enough tension to approximate edges (do not strangulate)
- use appropriate needles and sutures
- ensure good cosmesis

Figure 12. Basic suture methods

Steps to Ensuring Good Suturing Cosmesis

- Incisions should be made along relaxed skin tension lines
- Attain close apposition of wound edges
- Minimize tension on skin by closing in layers
- Evert wound edges
- Use appropriately sized suture for skin closure (5-0, 6-0 on face; 3-0, 4-0 elsewhere)
- Ensure equal width and depth of tissue on both sides
- Remove sutures within 5-7 d from the face, 10-14 d from scalp/torso/extremities

Other Skin Closure Materials

- tapes: may be indicated for superficial wounds and those with opposable edges. Tape cannot be used on actively bleeding wounds. When placed across the incision, will prevent surface marks and can be used primarily or after surface sutures have been removed. Tape burns may occur if there is excessive tension or swelling around the incision
- skin adhesives: e.g. 2-octylcyanoacrylate (e.g. Dermabond®) works well on small areas without much tension or shearing; may cause irreversible tattooing
- staples: steel-titanium alloys that incite minimal tissue reaction (healing is comparable to wounds closed by suture)

Traumatic tattoos are permanent discolourations resulting from new skin growth over foreign material or dirt left behind in the dermis. Copious irrigation and debridement should be done ASAP

Relaxed Skin Tension Lines

Natural skin/wrinkle lines with minimal linear tension. Placing incisions parallel to relaxed skin tension lines minimizes widening/hypertrophy, and helps to camouflage scars. Relaxed skin tension lines are usually perpendicular to muscle

Excision

- plan your incision along relaxed skin tension lines to minimize appearance of scar
- use elliptical incision to prevent “dog ears” (heaped up skin at end of incision) so the length of the ellipse should be approximately 3x the width
- if needed, undermine skin edges to decrease wound tension
- use layered closure including dermal sutures when wound is deeper than superficial (decreases tension)

Skin Biopsy Types and Techniques

SHAVE BIOPSY

- used for superficial lesions where sampling of the full thickness of the dermis is not necessary or practical
- most suitable lesions for shave biopsies are either elevated above the skin or have pathology confined to the epidermis (e.g. seborrheic or actinic keratoses, skin tags, warts, and superficial basal cell or squamous cell carcinomas)
- rapid, requires little training, and does not require sutures for closure
- will leave a circular scar
- can leave an indented scar
- heals by secondary intent (moist dressings should be used)
- should not be used for pigmented lesions – an unsuspected melanoma cannot be properly staged if partially removed

INCISIONAL BIOPSY

- can either be a punch biopsy or can be an ellipse including the lesion
- gives pathologists a portion of the lesion and the border with normal skin too

PUNCH BIOPSY

- involves the removal of a core-shaped piece of tissue, performed with round, disposable knives ranging in diameter from 2-10 mm
- allows sampling of the deep dermis
- can be used for the diagnosis and treatment of small pigmented lesions and atypical moles
- punch biopsy wounds can be closed with suture or left to heal by secondary intention. Punches greater than 3 mm may produce scarring and are best closed with one or two sutures
- has low incidence of infection, bleeding, nonhealing, significant scarring

EXCISIONAL BIOPSY

- performed for lesions that require complete removal for diagnostic or therapeutic purposes
- performed for lesions that cannot be adequately punch biopsied due to size, depth, or location
- requires the greatest amount of expertise and time
- always requires sutures for closure

TECHNIQUE

General

- all biopsies performed in clinic are done using aseptic technique, but are not sterile
- sterile gloves are indicated for biopsies and excisions in all patients

Preparing the Site

- common skin antiseptics (betadine, chlorhexidine) can be used to prepare the biopsy site
- chlorhexidine is used in concentrations ranging from 0.5-4%. This higher concentration cannot be used on the face as it could get into the eyes or ears and may burn or cause damage. Most chlorhexidine preps also contain alcohol which can be flammable, so allow to dry before the biopsy and certainly before using any cautery
- mark the intended lesion and surgical margins with a surgical marker since they may be temporarily obliterated following injection of the anesthetic
- for all biopsies, a sterile drape technique is indicated. A fenestrated surgical drape is placed around the biopsy site after the area is cleansed and anesthetized

Anesthesia

- most commonly used local anesthetic is 1% or 2% lidocaine (with epinephrine)
- small amounts of epinephrine are added to constrict blood vessels, decrease bleeding, prolong anesthesia, and limit lidocaine toxicity. The local with epinephrine can be injected directly into the lesion

Figure 13. Incision of lesions along relaxed skin tension lines

- local anesthetics with epinephrine may be used anywhere in the body (including the digits – except if the digits have been significantly injured and could have vascular compromise – e.g. saw injury)
- epinephrine should be avoided in patients with history of vascular compromise
- a field block should be performed for larger lesions by placing a ring of anesthetic around the surgical site, advancing and injecting through a site that has been previously anesthetized

Wounds

Causal Conditions

- laceration: cut or torn tissue
- abrasion: superficial skin layer is removed, variable depth
- contusion: injury caused by forceful blow to the skin and soft tissue; entire outer layer of skin intact yet injured
- avulsion: tissue/limb forcefully separated from surrounding tissue, either partially or fully; “de-gloving”
- puncture wounds: cutaneous opening relatively small as compared with depth (e.g. needle)
 - includes bite wounds
- crush injuries: caused by compression
- thermal and chemical wounds

Principles of Wound Healing

- wound: disruption of the normal anatomical relationships of tissue as a result of injury

FACTORS INFLUENCING WOUND HEALING

Local (reversible/controllable)

- mechanical (local trauma, tension)
- blood supply (ischemia/circulation)
- temperature
- technique and suture materials
- retained foreign body
- infection
- hematoma/seroma (↑ infection rate)
- venous HTN
- peripheral vascular disease
- PVD

General (often irreversible)

- age
- nutrition (protein, vitamin C, O₂)
- smoking
- chronic illness (e.g. DM, cancer, CVD)
- immunosuppression (steroids, chemo, radiation)
- collagen vascular disease
- tissue irradiation

STAGES OF WOUND HEALING

- growth factors released by tissues play an important role
- scar is mature once it has completed the final stage, usually after 1 yr

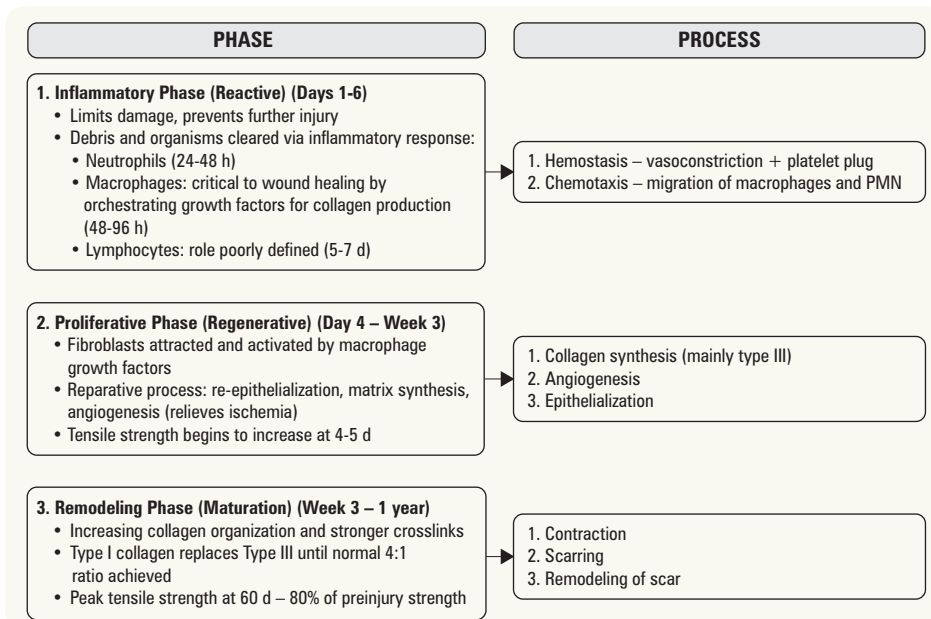

Figure 14. Stages of wound healing

ABNORMAL HEALING

Hypertrophic Scar

- scar remains roughly within boundaries of original scar
- red, raised, widened, frequently pruritic
- common sites: back, shoulder, sternum
- treatment: scar massage, pressure garments, silicone gel sheeting, corticosteroid injection, surgical excision if other options fail (however, may still recur)

Keloid Scar

- scar grows outside boundaries of original scar
- red, raised, widened, frequently pruritic
- caused by 1. genetic factors, 2. endocrine factors and/or 3. excess tension on wound or delayed closure (as in burn wounds)
- common sites: back, shoulder, sternum, angle of mandible
- treatment: multimodal therapy, including pressure garments, silicone gel sheeting, corticosteroid injection, surgical excision with post-surgical management if other options fail (however, may still recur), fractional carbon dioxide ablative laser, radiation

Chronic Wound

- fails to achieve primary wound healing within 4-6 wk
- common chronic wounds include diabetic, pressure and venous stasis ulcers
- treatment: may heal with meticulous wound care; may also require surgical intervention
- Marjolin's ulcer: squamous cell carcinoma arising in a chronic wound secondary to genetic changes caused by chronic inflammation → consider biopsy of chronic wound

WOUND HEALING

Primary (1°) Healing (First Intention)

- definition: wound closure by direct approximation of edges within hours of wound creation (i.e. with sutures, staples, skin graft, etc.)
- indication: recent (<6 h, longer with facial wounds), clean wounds
- contraindications: animal/human bites (except on face), crush injuries, infection, long time lapse since injury (>6-8 h), retained foreign body

Secondary (2°) Healing/Spontaneous Healing (Second Intention)

- definition: wound left open to heal spontaneously (epithelialization 1 mm/d from wound margins in concentric pattern), contraction (myofibroblasts) and granulation – maintained in inflammatory phase until wound closed; requires dressing changes; inferior cosmetic result
- indication: when 1° closure not possible or indicated (see *Primary Healing*)

Myofibroblasts are the cells responsible for wound contraction; they do this at a rate of less than 0.75 mm/d

Tertiary (3°) Healing/Delayed Primary Healing (Third Intention)

- definition: intentionally interrupt healing process (e.g. with packing), then wound can be closed at 4-10 d post-injury after granulation tissue has formed and there is $<10^5$ bacteria/gram of tissue
- indication: contaminated (high bacterial count), long time lapse since initial injury, severe crush component with significant tissue devitalization, closure of fasciotomy wounds
- prolongation of inflammatory phase decreases bacterial count and lessens chance of infection after closure

Contaminated and Infected Wounds

Definitions

- contamination: the presence of non-replicating microorganisms within a wound
- colonization: the presence of replicating microorganisms within a wound
- infection: greater than 10^5 microorganisms in a wound without intact epithelium, a wound may also be infected with small amounts of a very virulent organism (e.g. GBS)

Management of Acute Contaminated Wound (<24 h)

- cleanse and irrigate open wound with physiologic solution (NS or RL) using sufficient pressure
- evaluate for injury to underlying structures (vessels, nerve, tendon and bone)
- control active bleeding
- debridement: removal of foreign material, devitalized tissue, old blood
 - surgical debridement: blade and irrigation if indicated
- systemic antibiotics are commonly indicated for obvious infection. Risk factors include wound older than 8 h, severely contaminated, human/animal bites, immunocompromised, involvement of deeper structures (e.g. joints, fractures)
- ± tetanus toxoid 0.5 mL IM ± tetanus immunoglobulin 250 U deep IM (see Table 7 and Table 8)

Risk Factors for Infection

- Virulence of the infecting microorganism
- Amount of bacteria present
- Host resistance

- \pm post-exposure treatment of
 - hepatitis B, HIV, hepatitis C (if titres confirmed at 6 mo)
- re-evaluate in 24-48 h for signs of superficial or deep infection
 - if evidence of infection, open infected portion of wound by removing sutures (i.e. erythema, warmth, pain, discharge), swab sample for culture and sensitivity, irrigate wound and allow healing secondary intention

Table 7. Risks for Tetanus

Wound Characteristics	Tetanus-Prone	Not Tetanus-Prone
Time since injury	>6 h	<6 h
Depth of injury	>1 cm	<1 cm
Mechanism of Injury	Crush, burn, gunshot, frostbite, puncture through clothing, farming injury	Sharp cut (e.g. clean knife, clean glass)
Devitalized tissue	Present	Not present
Contamination (e.g. soil, dirt, saliva, grass)	Yes	No
Retained foreign body	Yes	No

Table 8. Tetanus Immunization Recommendations

History of Tetanus Immunization	Clean, Minor Wounds		All Other Wounds	
	Td or Tdap*	Tig**	Td or Tdap	Tig
Uncertain or <3 doses of immunization	Yes	No	Yes	Yes
3 doses received in immunization series	No~	No	No§	No¶

* 0.5 mL of combined tetanus and diphtheria toxoids \pm acellular pertussis

~ Yes, if >10 yr since last booster

¶ Yes, if immunocompromised

** Tetanus immune globulin, 250 U given at a separate site from Td/Tdap

§ Yes, if >5 yr since last booster

Management of Contaminated Wounds (>24 h, including ulcers)

- irrigation and debridement
 - traumatic tattooing can occur if foreign materials left in wound
- systemic antibiotics indicated if there is concern of infection (e.g. redness, swelling, pain, clinically unwell)
- topical antimicrobials: beneficial for minor wounds, but no additional benefit for wounds requiring systemic antibiotics. May aid in healing of chronic wounds
- closure: final closure via secondary intention (most common), delayed wound closure (3° closure), skin graft or flap; successful closure depends on bacterial count of $\leq 10^5/\text{cm}^3$ prior to closure and frequent dressing changes

BITES

- see [Emergency Medicine](#), ER47

Dog and Cat Bites

- pathogens: *Pasteurella multocida*, *S. aureus*, *S. viridans*
- investigations: same as for human bites
- treatment: Clavulin* (500 mg PO q8h started immediately – amoxicillin + clavulanic acid)
 - consider rabies prophylaxis if animal has symptoms of rabies or unknown animal
 - ♦ \pm rabies Ig (20 IU/kg around wound, or IM) and 1 of the 3 types of rabies vaccines (1.0 mL IM in deltoid, repeat on days 3, 7, 14, 28)
 - aggressive irrigation with debridement
 - healing by secondary intention is mainstay of treatment
 - only consider primary closure for bite wounds on the face; otherwise primary closure is contraindicated
 - contact Public Health if animal status unknown

Human Bites

- pathogens: *Staphylococcus* > α -hemolytic *Streptococcus* > *Eikenella corrodens* > *Bacteroides*
- mechanism: most commonly over dorsum of MCP from a punch in mouth; “fight-bite”
- serious, as mouth has 10^9 microorganisms/mL, which get trapped in joint space when fist unclenches and overlying skin forms an air-tight covering ideal for anaerobic growth – can lead to septic arthritis
- investigations
 - radiographs prior to therapy to rule out foreign body (e.g. tooth) or fracture
 - culture for aerobic and anaerobic organisms, Gram stain
- treatment
 - urgent surgical exploration of joint, drainage and debridement of infected tissue
 - wound must be copiously irrigated
 - Clavulin* 500 mg PO q8h or (if penicillin allergy) clindamycin 300 mg PO q6h + ciprofloxacin 500 mg PO q12h + secondary closure
 - splint

Dressings

- there is no one dressing for any given type of wound. Dressing selection depends on the wound characteristics and surgeon preference
 - as the wound progresses through healing it will require different types of dressings, therefore, routine inspection is recommended
 - principles of dressings
 - ♦ moist vs. dry wounds
 - purpose of dressings should be to promote moist wound healing (i.e. moistening dry wounds or removing excess exudate/blood from wet wounds)
 - ♦ clean vs. infected wounds
 - clean wounds can be dressed with non-adherent dressing (which is non-adhering to epithelializing tissue); requires secondary dressing
 - infected wounds can be dressed with iodine gauze, silver-containing, or antimicrobial dressings
 - ♦ wide-based vs. cavitary/tunneling wounds
 - cavitary or tunnelling wounds (i.e. through a fascial layer) can be packed with saline-soaked (non-infected), betadine-soaked (infected) ribbon gauze, or other easily retrievable one-piece moisture providing dressing

Negative-pressure wound therapy uses sealed vacuum dressings that remove wound fluid and promote increased blood flow to enhance the healing process

Table 9. Recommended Dressings for Wound Type

Wound Depth	Exudate Level	Dressing Material
Superficial	Lightly exuding	Films (Opsite®), hydrogels (Intrasite®, Nu-gel®, Duoderm®)
	Any exudate level	Contact layers
Superficial to Deep	Light to moderately exuding wounds	Amorphous gels, hydrogels, hydrocolloids (Duoderm®, Tegaderm®), collagen, hypertonic saline gauze (Mesalt®)
	Moderately to heavily exuding wounds	Foams (Mepilex®, Allevyn®), alginates (Sorbsan®, Kaltostat®), hypertonic saline gauze, hydrofibre (Aquacel®)

Table adapted from Grabb & Smith's Plastic Surgery, 6th ed. Chapter 3, Table 3.3

Reconstruction

RECONSTRUCTION LADDER

Definition

- an approach to wound management with successively more complex methods of treatment
- surgeons should start with the least complex method and progressively increase in complexity as appropriate

Reconstruction Ladder (in the order of increasing complexity of treatment)

- Healing by secondary intention
- Primary closure
- Delayed closure
- Split thickness graft
- Full thickness graft
- Random pattern flap
- Pedicle flap
- Tissue expansion
- Free flap

SKIN GRAFTS

Definition

- skin that is harvested from a donor site and transferred to the recipient site and that does not carry its own blood supply. Survival requires the generation of new blood vessels from the recipient site bed. They are classified according to the depth of dermis they contain: full thickness (entire epidermis + dermis) vs. split-thickness (epidermis + partial dermis)

Donor Site Selection

- must consider size, hair pattern, texture, thickness of skin, and colour (facial grafts best if taken from “blush zones” above clavicle e.g. pre/post auricular or neck)
- partial thickness grafts usually taken from inconspicuous areas (e.g. buttocks, lateral thighs, etc.)

Partial Thickness Skin Graft Survival

- 3 phases of skin graft “take”
 1. plasmatic imbibition: diffusion of nutrition from recipient site (first 48 h)
 2. inosculation: vessels in graft connect with those in recipient bed (day 2-3)
 3. neovascular ingrowth: graft revascularized (day 3-5)
- requirements for survival
 - bed: well-vascularized (unsuitable: bone, tendon, heavily irradiated, infected wounds, etc.)
 - contact between graft and recipient bed: fully immobile (decreased shearing and hematoma formation)
 - staples, sutures, splinting, and appropriate dressings (pressure) are used to prevent movement of graft and hematoma or seroma formation
 - site: low bacterial count ($<10^5/\text{cm}^3$, to prevent infection)

Classification of Skin Grafts

1. by species
 - autograft: from same individual
 - allograft (homograft): from same species, different individual
 - xenograft (heterograft): from different species (e.g. porcine)
2. by thickness: see [Table 10](#)

Table 10. Skin Grafts

	Split Thickness Skin Graft	Full Thickness Skin Graft
Definition	Epidermis and part of dermis	Epidermis and all of dermis
Donor Site	More sites	Donor sites limited by the ability to use primary closure
Healing of Donor Site	Re-epithelialization via dermal appendages in graft and wound edges	Primary closure
Re-Harvesting	~10 d (faster on scalp)	N/A
Graft Take	More reliable and better survival; shorter nutrient diffusion distance	Lower rate of survival (thicker, slower vascularization)
Contraction*	Less 1° contraction, greater 2° contraction (less with thicker graft)	Greater 1° contraction, less 2° contraction
Aesthetic	Poor	Good
Comments	Can be meshed for greater area Allows for extravasation of blood/serum	May use on face and fingers
Advantages	Takes well in less favourable conditions, Can cover a larger area Can be meshed for greater area Allows for extravasation of blood/serum Potential for healing in less favourable environment Large number of donor sites	Resists contraction, better colour match May use on face and fingers
Disadvantages	Contracts significantly, abnormal pigmentation, high susceptibility to trauma	Requires well vascularized bed Must remove fat from graft before application
Uses	Large areas of skin, granulating tissue beds	Face (colour match), site where thick skin or decreased contracture is desired (e.g. finger)

*Primary: immediate reduction in size upon harvesting; Secondary: reduction in size once graft placed on wound bed

- mesh graft (split of full thickness skin graft)
 - **advantages**
 - ♦ prevents accumulation of fluids (e.g. hematoma, seroma)
 - ♦ covers a larger area
 - ♦ best for contaminated recipient site
 - **disadvantages**
 - ♦ poor cosmesis (“alligator hide” appearance)
 - ♦ has significant contraction
- common reasons for graft loss: hematoma/seroma, infection, mechanical force (e.g. shearing, pressure)

OTHER GRAFTS

Table 11. Various Tissue Grafts

Graft Type	Use	Preferred Donor Site
Bone	Repair rigid defects	Cranial, rib, iliac, fibula
Cartilage	Restore contour of ear and nose	Ear, nasal septum, costal cartilage
Tendon	Repair damaged tendon	Palmaris longus, plantaris (present in 85% population)
Nerve	Conduit for regeneration across nerve gap	Sural, antebrachial cutaneous, medial brachial cutaneous
Vessel	Bridge vascular gaps	Forearm or foot vessels for small vessels, saphenous vein for larger vessels
Dermis	Contour restoration (± fat for bulk)	Thick skin of buttock or abdomen
Fat	Contour restoration	Abdomen, any area with fat available

FLAPS

- **definition:** tissue transferred from one site to another with a known blood supply (random, pedicled or named); not dependent on neovascularization, unlike a graft
- **may consist of:** skin, subcutaneous tissue, fascia, muscle, bone, other tissue (e.g. omentum)
- **classification:** based on blood supply to skin (random, axial) and anatomic location (local, regional, distant)
- **indications for flaps**
 - replaces tissue loss due to trauma or surgery (reconstruction)
 - provides skin and temporary soft tissue coverage through which surgery can be carried out later
 - to aid healing or treatment of infection by providing vascularized tissue to a poorly vascularized bed

- **complications:** flap loss due to hematoma, seroma, infection, poor flap design, extrinsic compression (dressing too tight) or vascular failure/thrombosis, fat necrosis (in free and pedicled flaps)

Random Pattern Flaps

- blood supply by dermal and subdermal plexus to skin and subdermal tissue with random vascular supply
- limited length:width ratio to ensure adequate blood supply (typically 3:1)
- flap choice is often a combination of available tissue, type of tissue needed, location of reconstruction site with respect to donor site, and surgeon preference
- **types**
 - **rotation:** semicircular tissue rotated around a pivot point for defect closure; commonly used on sacral pressure sores
 - **transposition:** tissue is transposed around a pivot point from one location to another; commonly used on certain areas of the face using adjacent areas of excess skin laxity
 - **Z-plasty:** two triangular flaps are repositioned; used to reorient a scar, lengthen the line of a scar or to break up a scar
 - **advancement flaps (V-Y, Y-V):** defect is closed with unidirectional tissue advancement
 - ♦ single/bipedicle V-Y flaps: wounds with lax surrounding tissue; the pedicle is the deep tissue underlying the flap

Figure 15. Wound care flaps – random pattern

Axial Pattern Flaps (Arterialized)

- flap contains a well defined artery and vein
- allows greater length:width ratio (5-6:1)
- **types**
 - **peninsular flap:** skin and vessel intact in pedicle
 - **island flap:** vessel intact, pedicle is better defined
 - **free flap:** vascular supply anastomosed at recipient site by microsurgical techniques
- can be sub-classified according to tissue content of flap
 - e.g. musculocutaneous/myocutaneous (e.g. transverse rectus abdominal myocutaneous) vs. fasciocutaneous

Free Flaps

- transplanting expendable donor tissue from one part of the body to another by isolating and dividing a dominant artery and veins to a flap and performing a microsurgical anastomosis between these and the vessels in the recipient wound
- survival rates >95%
- **types:** muscle and skin (common), bone, jejunum, omentum, fascia
 - e.g. radial forearm, scapular, latissimus dorsi

Figure 16. Peninsular axial pattern flap

Figure 17. Island axial pattern flap

Table 12. Characteristics of Healthy Free Flaps

Characteristic	Normal	Arterial Insufficiency	Venous Insufficiency
Colour	Pink	Pale	Purple or blue
Temperature	Warm	Cool	Warm or cool
Arterial Pulse (Doppler)	+	–	±
Turgor	Soft, but with some firmness	Decreased tissue firmness	Increased (tissue firmness with tissue stiffness)

Soft Tissue Infections

Table 13. Classification of Soft Tissue Infections by Depth

Erysipelas	Superficial with subcutaneous tissue involvement
Cellulitis	Full thickness with subcutaneous tissue involvement
Fasciitis	Fascia
Myositis	Muscle

Erysipelas

Definition

- acute skin infection that is more superficial than cellulitis

Etiology

- typically caused by Group A β -hemolytic *Streptococcus*

Clinical Features

- intense erythema, induration, and **sharply demarcated borders** (differentiates it from other skin infections)

Treatment

- penicillin or first generation cephalosporin (e.g. cefazolin or cephalexin)

Cellulitis vs. Erysipelas
Cellulitis: indistinct borders
Erysipelas: sharp borders

Cellulitis

Definition

- non-suppurative infection of skin and subcutaneous tissues

Etiology

- skin flora most common organisms: *S. aureus*, β -hemolytic *Streptococcus*
- immunocompromised: Gram-negative rods and fungi

Clinical Features

- source of infection
 - trauma, recent surgery
 - PVD, DM – cracked skin in feet/toes
 - foreign bodies (IV, orthopedic pins)
- systemic symptoms (fever, chills, malaise)
- pain, tenderness, edema, erythema with poorly defined margins, regional lymphadenopathy
- can lead to ascending lymphangitis (visible red streaking in skin proximal to area of cellulitis)

Investigations

- CBC, blood cultures
- culture and Gram stain a collection/aspirate from wound if open wound
- plain radiographs cannot distinguish cellulitis from necrotizing fasciitis or gas gangrene but may help distinguish osteomyelitis

Treatment

- antibiotics: first line – cephalexin 500 mg PO q6h or cloxacillin 500 mg PO q6h x 7 d; if complicated (e.g. lymphangitis, DM, severe infection, oral antibiotic therapy failure) consider IV cefazolin 1-2 g q8h or V cloxacillin, IV penicillin
- outline area of erythema to monitor success of treatment
- immobilize and splint (hands)

Necrotizing Fasciitis

Definition

- rapidly spreading, very painful infection of the fascia with necrosis of surrounding tissues
- some bacteria create gas that can be felt as crepitus and be seen on x-rays
- infection spreads rapidly along deep fascial plane and is **limb and life threatening**

Etiology

- Type I: polymicrobial (less aggressive)
- Type II: monomicrobial, usually β -hemolytic *Streptococcus*

Clinical Features

- **pain out of proportion to clinical findings and beyond border of erythema**
 - edema, tenderness, \pm crepitus (subcutaneous gas from anaerobes)
- overlying skin changes including blistering and ecchymoses
- hyponatremia and hyperglycemia are common findings
- patients may look deceptively well at first, but may rapidly become very sick/toxic
- late findings
 - skin turns dusky blue and black (secondary to thrombosis and necrosis)
 - induration, formation of bullae
 - cutaneous gangrene, subcutaneous emphysema

Investigations

- **a clinical diagnosis**
- CT scan only if suspect it is not necrotizing fasciitis (looking for abscess, gas collection, myonecrosis and possible source of infection)
- severely elevated CK: usually means myonecrosis (late sign)
- bedside incision and exploration when ruling out conditions, clinical presentation is not supportive or difficult exam
- during incisional biopsy, often see "dish water pus" (Group A infection) and a hemostat easily passed along fascial plane (fascial biopsy to rule out in equivocal situations)

Treatment

- vigorous resuscitation (ABCs)
- urgent surgical debridement: remove all necrotic tissue, copious irrigation
- IV antibiotics: as appropriate for clinical scenario; consider penicillin 4 million IU IV q4h and/or clindamycin 900 mg IV q6h until final cultures available (the combination can be synergistic if Group A strep)
- possible role for IVIg (especially in Group A strep, adjuvant treatment on a case by case basis)
- urgent consultation with infectious disease specialist is recommended

Ulcers

Lower Limb Ulcers

Traumatic Ulcers (Acute)

- failure of wound to heal, usually due to compromised blood supply and unstable scar, secondary to pressure or bacterial colonization/infection
- usually over bony prominence \pm edema \pm pigmentation changes \pm pain
- treatment: debridement of ulcer and compromised tissue, left to heal via secondary intention with dressings, may need reconstruction with local or distant flap in select cases, vascular status of limb must be assessed clinically and via vascular studies (i.e. ABI, duplex doppler)

Non-Traumatic Ulcers (Chronic)

Table 14. Venous vs. Arterial vs. Diabetic Ulcers

Characteristic	Venous (70% of vascular ulcers)	Arterial	Diabetic
Cause	Valvular incompetence Venous HTN	2° to small and/or large vessel disease (be aware of risk factors)	Peripheral neuropathy: decreased sensation Atherosclerosis: microvascular disease
History	Dependent edema, trauma Rapid onset \pm thrombophlebitis, varicosities	Arteriosclerosis, claudication Usually >45 yr Slow progression	DM Peripheral neuropathy Trauma/pressure
Common Distribution	Medial malleolus ("Gaiter" locations)	Distal locations (e.g. lower limb, feet)	Pressure point distribution (more likely feet)

Table 14. Venous vs. Arterial vs. Diabetic Ulcers (continued)

Characteristic	Venous (70% of vascular ulcers)	Arterial	Diabetic
Appearance	Yellow exudates Granulation tissue Varicose veins Brown discoloration of surrounding skin	Pale/white, necrotic base \pm dry eschar covering	Necrotic base
Wound Margins	Irregular	Even ("punched out")	Irregular or "punched out" or deep
Depth	Superficial	Deep	Superficial/deep
Surrounding Skin	Venous stasis discoloration (brown)	Thin shiny dry skin, hairless, cool	Thin dry skin \pm hyperkeratotic border Hypersensitive/ischemic
Pulses	Normal distal pulses	Decreased or no distal pulses	Decreased pulses likely
Vascular Exam	ABI >0.9 Doppler; abnormal venous system	ABI <0.9 Pallor on elevation, rubor on dependency Delayed venous filling	ABI is inaccurately high (due to PVD) Usually associated with arterial disease
Pain	Moderately painful Increased with leg dependency, decreased with elevation No rest pain	Extremely painful Decreased with dependency, increased with leg elevation and exercise (claudication) Rest pain	Painless No claudication or rest pain Associated paresthesia, anesthesia
Treatment	Leg elevation, rest Compression at 30 mmHg (stockings or elastic bandages) Moist wound dressings \pm topical, systemic antibiotics if infected \pm skin grafts	Rest, no elevation, no compression Moist wound dressing \pm topical and/or systemic antibiotics if infected Modify risk factors (smoking, diet, exercise, etc.) Vascular surgical consultation (angioplasty or bypass) Treat underlying conditions (DM, proximal arterial occlusion, etc.)	Control DM Careful wound care Foot care Orthotics Early intervention for infections (topical and/or systemic antibiotics if infected) Vascular surgical consultation

ABI in diabetics can be falsely normal due to incompressible arteries secondary to plaques/calcification

All chronic ulcers require vascular studies, and a vascular consult, to assess for venous insufficiency, to rule in/out arterial pathology and to find out the potential role of vascular surgical management

Pressure Ulcers

Common Sites

- over bony prominences; 95% on lower body

Stages of Development

1. hyperemia: disappears 1 h after pressure removed
2. ischemia: follows 2-6 h of pressure
3. necrosis: follows >6 h of pressure
4. ulcer: necrotic area breaks down – N.B. skin is like tip of an iceberg

Classification (National Pressure Ulcer Advisory Panel 2014)

- Stage I: nonblanchable erythema present >1 h after pressure relief, skin intact
- Stage II: partial-thickness skin loss
- Stage III: full-thickness skin loss into subcutaneous tissue
- Stage IV: full-thickness skin loss into muscle, bone, tendon, or joint
 - if an eschar is present, must fully debride before staging possible

Prevention

- good nursing care (clean dry skin, frequent repositioning), special beds or pressure relief surface, proper nutrition, activity, early identification of individuals at risk (e.g. immobility, incontinence, paraplegia, immunocompromised, DM etc.)

Treatment

- depends on individual patient and condition
- treat underlying medical issues including nutrition
- continue with preventative measures (pressure relief and assess for pressure points e.g. wheelchairs)
- wound debridement, moisture retentive or antimicrobial dressing, regular reassessment
- topical antimicrobials at treating physician's discretion, systemic antibiotics for infections
- assess for possible reconstruction

Complications

- cellulitis, osteomyelitis, sepsis, gangrene

Burns

Burn Injuries

Causal Conditions

- thermal (flame contact, scald)
- chemical
- radiation (UV, medical/therapeutic)
- electrical

Most Common Etiology

- children: scald burns
- adults: flame burns

Table 15. Skin Function and Burn Injury

Skin Function	Consequence of Burn Injury	Intervention Required
Thermoregulation	Prone to lose body heat	Must keep patient covered and warm
Control of fluid loss	Loss of large amounts of water and protein from the skin and other body tissues	Adequate fluid resuscitation is imperative
Mechanical barrier to bacterial invasion and immunological organ	High risk of infection	Antimicrobial dressings (systemic if signs of specific infection present) Tetanus prophylaxis if necessary

Pathophysiology of Burn Wounds

- amount of tissue destruction is based on temperature, time of exposure, and specific heat of the causative agent
- **zone of hyperemia**: vasodilation from inflammation; entirely viable, cells recover within 7 d; contributes to systemic consequences seen with major burns
- **zone of stasis (edema)**: decreased perfusion; microvascular sludging and thrombosis of vessels results in progressive tissue necrosis → cellular death in 24-48 h without proper treatment
 - factors favouring cell survival: moist, aseptic environment, rich blood supply
 - zone where appropriate early intervention has most profound effect in minimizing injury
- **zone of coagulation (ischemia)**: no blood flow to tissue → irreversible cell damage → cellular death/necrosis

Figure 18. Zones of thermal injury

Diagnosis and Prognosis

- burn size
 - % of TBSA burned: rule of 9s for 2° and 3° burns only (children <10 yr old use Lund-Browder chart)
 - for patchy burns, surface area covered by patient's palm (fingers closed) represents approximately 1% of TBSA
- age: more complications if <3 or >60 yr old
- depth: difficult to assess initially – history of etiologic agent and time of exposure helpful (see Table 16)
- location: face and neck, hands, feet, perineum are critical areas requiring special care of a burn unit (see *Indications for Transfer to Burn Centre*, PL18)
- inhalation injury: can severely compromise respiratory system
- associated injuries (e.g. fractures)
- comorbid factors (e.g. concurrent disability, alcoholism, seizure disorders, chronic renal failure) can exacerbate extent of injury

Prognosis best determined by

- burn size (TBSA)
- age of patient
- presence/absence of inhalational injury

Prognosis best determined by burn size (TBSA), age of patient, presence/absence of inhalation injury

Circumferential burns can restrict respiratory excursion and/or blood flow to extremities and require escharotomy

TBSA does not include areas with 1° burns

Figure 19. Rule of 9s for TBSA

Figure 20. Lund-Browder diagram

 Table 16. Burn Depth (1st, 2nd, 3rd degree)

Nomenclature	Traditional Nomenclature	Depth	Clinical Features
Erythema/Superficial	First degree	Epidermis	Painful, sensation intact, erythema, blanchable
Superficial-Partial Thickness	Second degree	Into superficial dermis	Painful, sensation intact, erythema, blisters with clear fluid, blanchable, hair follicles present
Deep-Partial Thickness	Second degree	Into deep (reticular) dermis	Insensate, difficult to distinguish from full thickness, does not blanch, some hair follicles still attached, softer than full thickness burn
Full Thickness	Third degree Fourth degree	Through epidermis and dermis Injury to underlying tissue structures (e.g. muscle, bone)	Insensate (nerve endings destroyed), hard leathery eschar that is black, grey, white, or cherry red in colour, hairs do not stay attached, may see thrombosed veins

Indications for Transfer to Burn Centre

American Burn Association Criteria

- patients with partial or full-thickness burns that involve the hands, feet, genitalia, face, eyes, ears, and/or major joints or perineum
- partial thickness burns $\geq 20\%$ TBSA in patients aged 10-50 yr old
- partial thickness burns $\geq 10\%$ TBSA in children aged ≤ 10 or adults aged ≥ 50 yr old
- full thickness burns $\geq 5\%$ TBSA in patients of all ages
- electrical burns, including lightening (internal injury underestimated by TBSA)
- chemical burns
- inhalation injury (high risk of mortality and may lead to respiratory distress)
- burn injuries in patients with medical comorbidities, could complicate management and recovery
- any patient with simultaneous trauma plus burns should be stabilized for trauma first, then triaged appropriately to burn centre
- any patients with burn injury and who will require special emotional, social, and rehabilitation intervention
- children with burns in a hospital not equipped with pediatric care specialists

Acute Care of Burn Patients

- adhere to ATLS protocol
- resuscitation using Parkland formula to restore plasma volume and cardiac output, Parkland formula is a starting estimate and patients may require more volume. Other formulas exist but the Parkland formula is predominately used in North America
 - 4 cc RL/kg/% TBSA over first 24 h (1/2 within first 8 h of sustaining burn, 1/2 in next 16 h)
- extra fluid administration required if
 - burn $>80\%$ TBSA
 - 4° burns
 - associated traumatic injury
 - electrical burn
 - inhalation injury
 - delayed start of resuscitation
 - pediatric burns
- monitor resuscitation
 - urine output is best measure: maintain at >0.5 cc/kg/h (adults) and 1.0 cc/kg/h (children <12 yr)
 - maintain a clear sensorium, HR <120 /min, MAP >70 mmHg
- burn specific care
 - relieve respiratory distress: intubation and/or escharotomy
 - Escharotomy in circumferential extremity burn
 - prevent and/or treat burn shock: 2 large bore IVs for fluid resuscitation
 - insert Foley catheter to monitor urine output
 - identify and treat immediate life-threatening conditions (e.g. inhalation injury, CO poisoning)
 - determine TBSA affected first, since depth is difficult to determine initially (easier to determine after 24 h)
- tetanus prophylaxis if needed
 - all patients with burns $>10\%$ TBSA, or deeper than superficial partial thickness, need 0.5 cc tetanus toxoid
 - also give 250 U of tetanus Ig if prior immunization is absent/unclear, or the last booster >10 yr ago
- baseline laboratory studies (Hb, U/A, BUN, CXR, electrolytes, ECG, cross-match if traumatic injury, ABG, carboxyhemoglobin)
- cleanse, debride, and treat the burn injury (antimicrobial dressings)
- early excision and grafting important for outcome

Respiratory Problems

- 3 major causes
 - burn eschar encircling chest
 - ♦ distress may be apparent immediately
 - ♦ perform escharotomy to relieve constriction
 - CO poisoning
 - ♦ may present immediately or later
 - ♦ treat with 100% O₂ by facemask (decreases half-life of carboxyhemoglobin from 210 to 59 min) until carboxyHb $<10\%$

Inhalation Injuries 101

- Indicators of inhalation injury
 - Injury in a closed space
 - Facial burn
 - Singed nasal hair/eyebrows
 - Soot around nares/oral cavity
 - Hoarseness
 - Conjunctivitis
 - Tachypnea
 - Carbon particles in sputum
 - Elevated blood CO levels (i.e. brighter red)
- Suspected inhalation injury requires immediate intubation due to impending airway edema; failure to diagnose inhalation injury can result in airway swelling and obstruction, which, if untreated, can lead to death
- Neither CXR or ABG can be used to rule out inhalation injury
- Direct bronchoscopy now used for diagnosis
- Signs of CO poisoning (headache, confusion, coma, arrhythmias)

- smoke inhalation leading to pulmonary injury
 - ♦ chemical injury to alveolar basement membrane and pulmonary edema (insidious onset)
 - ♦ risk of pulmonary insufficiency (up to 48 h) and pulmonary edema (48-72 h)
 - ♦ watch for secondary bronchopneumonia (3-25 d) leading to progressive pulmonary insufficiency
 - ♦ intubate patient with any signs of inhalation injuries

Burn Wound Healing

Table 17. Burn Shock Resuscitation (Parkland Formula)

Hour 0-24	4 cc RL/kg/% TBSA with 1/2 of total in first 8 h from time of injury and 1/2 of total in next 16 h from time of injury
Hour 24-30	0.35-0.5 cc plasma/kg/%TBSA
>Hour 30	D5W at rate to maintain normal serum sodium

*Do not forget to add maintenance fluid to resuscitation

Table 18. Burn Wound Healing

Depth	Healing
First degree	No scarring; complete healing
Second degree (Superficial partial)	Spontaneously re-epithelialize in 7 to 14 d from retained epidermal structures ± residual skin discolouration Hypertrophic scarring uncommon; grafting rarely required
Deep second degree (Deep partial)	Re-epithelialize in 14-35 d from retained epidermal structures Hypertrophic scarring frequent Grafting recommended to expedite healing
Third degree (Full thickness)	Re-epithelialize from the wound edge Grafting/flap necessary to replace dermal integrity, limit hypertrophic scarring
Fourth degree	Often results in amputations If not requiring amputation, needs flap for coverage after debridement (do not re-epithelialize – cannot graft)

Treatment

- 3 stages
 1. assessment: depth determined
 2. management: specific to depth of burn and associated injuries
 3. rehabilitation
- first degree
 - treatment aimed at comfort
 - ♦ topical creams (pain control, keep skin moist) ± aloe
 - ♦ oral NSAIDs (pain control)
- superficial second degree
 - daily dressing changes with topical antimicrobials (such as polysporin); leave blisters intact unless circulation impaired or unless over joint inhibiting motion
- deep second degree and third degree
 - prevent infection and sepsis (significant cause of death in burn patients)
 - ♦ most common organisms: *S. aureus*, *P. aeruginosa* and *C. albicans*
 - day 1-3 (rare): Gram-positive
 - day 3-5: Gram-negative (*Proteus*, *Klebsiella*)
 - ♦ topical antimicrobials: treat colonized wounds (from skin flora, gut flora or caregiver)
 - remove dead tissue
 - ♦ surgically debride necrotic tissue, excise to viable (bleeding) tissue

Table 19. Antimicrobial Dressings for Burns

Antibiotic	Pain with Application	Penetration	Adverse Effects
Silver nitrate (0.5% solution)	None	Minimal	May cause methemoglobinemia, stains (black), leaches sodium from wounds
Nanocrystalline silver-coated dressing (Acticoat®)	None or transient	Medium, does not penetrate eschar	May stain, producing a pseudoeschar or facial discolouration (argyria-like symptoms); raised liver enzymes
Silver sulfadiazine (cream) (Silvadene®)	Minimal	Medium, penetrates eschar poorly	Slowed healing, leukopenia, mild inhibition of epithelialization
Mafenide acetate (solution/cream) (Sulfamylon®)	Moderate	Well, penetrates eschar	Mild inhibition of epithelialization, may cause metabolic acidosis with wide application

Risk Factors for Infection of Burn Wounds

Patient Related

- Extent >30% TBSA
- Depth: full-thickness and deep partial-thickness
- Patient age (higher risk with very young and very old)
- Comorbidities
- Wound dryness
- Wound temperature
- Secondary impairment of blood flow to wound
- Acidosis

Microbial Factors

- Density >10⁵ organisms per gram tissue
- Motility
- Virulence and metabolic products (endotoxin, exotoxin, permeability factors, other factors)
- Antimicrobial resistance

- early excision and grafting is the mainstay of treatment for deep/full thickness burns
- initial dressing should decrease bacterial proliferation
- prevention of wound contractures: pressure dressings, joint splints, early physiotherapy

Other Considerations in Burn Management

Figure 21. Systemic effects of severe burns

- nutrition
 - hypermetabolism: TBSA >40% have BMR 2-2.5x predicted
 - consider nutritional supplementation e.g. calories, vitamin C, vitamin A, Ca^{2+} , Zn^{2+} , Fe^{2+}
- immunosuppression and sepsis
 - must keep bacterial count $<10^5$ bacteria/g of tissue (blood culture may not be positive)
 - signs of sepsis: sudden onset of hyper/hypothermia, unexpected CHF or pulmonary edema, development of ARDS, ileus >48 h post-burn, mental status changes, azotemia, thrombocytopenia, hypofibrinogenemia, hyper/hypoglycemia (especially if burn >40% TBSA)
- GI bleed may occur with burns >40% TBSA (usually subclinical)
 - treatment: tube feeding or NPO, antacids, H_2 blockers (preventative)
- renal failure secondary to under resuscitation, drugs, myoglobin, etc.
- progressive pulmonary insufficiency
 - can occur after: smoke inhalation, pneumonia, cardiac decompensation, sepsis
- wound contracture and hypertrophic scarring (outcomes optimized with timely wound closure, splinting, pressure garments) and physiotherapy

Special Considerations

CHEMICAL BURNS

- major categories: acid burns, alkaline burns, phosphorous burns, chemical injection injuries
- common agents: cement, hydrofluoric acid, phenol, tar
- mechanism of injury: chemical solutions coagulate tissue protein leading to necrosis
 - acids → coagulation necrosis
 - alkalines → saponification followed by liquefactive necrosis
- severity related to: type of chemical (alkali worse than acid), temperature, volume, concentration, contact time, site affected, mechanism of chemical action, degree of tissue penetration
- burns are deeper than they initially appear and may progress with time

Treatment (General)

- ABCs, monitoring
- remove contaminated clothing and brush off any dry powders before irrigation
- irrigation with water for 1-2 h under low pressure (contraindicated in heavy metal burns, such as sodium, potassium, magnesium, and lithium; in these cases soak in mineral oil instead)
- inspect eyes, if affected: wash with saline and refer to ophthalmology
- inspect nails, hair and webspaces
- correct metabolic abnormalities and tetanus prophylaxis if necessary
- local wound care 12 h after initial dilution (debridement)
- wound closure same as for thermal burn
- beware of underestimated fluid resuscitation, renal, liver, and pulmonary damage

Special Burns and Treatments

Acid Burn	Water irrigation, followed by dilute solution of sodium bicarbonate
Hydrofluoroic Acid	Water irrigation; clip fingernails to avoid acid trapping; topical calcium gel ± subcutaneous injection of calcium gluconate ± 10% calcium gluconate IV depending on amount of exposure and pain
Sulfuric Acid	Treat with soap/lime prior to irrigation, as direct water exposure produces extreme heat
Tar	Remove with repeated application of petroleum-based antibiotic ointments (e.g. Polysporin®)

ELECTRICAL BURNS

- depth of burn depends on voltage and resistance of the tissue (injury more severe in tissues with high resistance)
- often presents as small punctate burns on skin with extensive deep tissue damage which requires debridement
- electrical burns require ongoing monitoring as latent injuries can occur
- watch for system specific damages and abnormalities
 - abdominal: intraperitoneal damage
 - bone: fractures and dislocations especially of the spine and shoulder
 - cardiopulmonary: anoxia, ventricular fibrillation, arrhythmias
 - muscle: myoglobinuria indicates significant muscle damage → compartment syndrome
 - neurological: seizures and spinal cord damage
 - ophthalmology: cataract formation (late complication)
 - renal: ATN resulting from toxic levels of myoglobin and hemoglobin
 - vascular: vessel thrombosis → tissue necrosis (increased Cr, K⁺ and acidity), decrease in RBC (beware of hemorrhages/delayed vessel rupture)

Treatment

- ABCs, primary and secondary survey, treat associated injuries
- beware of cardiac arrhythmias (continue cardiac monitoring)
- monitor: hemochromogenuria, compartment syndrome, urine output
- wound management: topical agent with good penetrating ability (silver sulfadiazine or mafenide acetate)
- debride non-viable tissue early and repeat prn (every 48 h) to prevent sepsis
- amputations frequently required

FROSTBITE

- see [Emergency Medicine](#), ER46

Tissue Resistance to Electrical Current

nerve < vessel/blood < muscle < skin
< tendon < fat < bone

Hand

Traumatic Hand

Table 20. Key Features of the History and Physical Exam of the Injured Hand in the Emergency Department

HISTORY		
Key Questions	Age	
	Hand dominance	
	Occupation	
	Time and place of accident	
	Mechanism of injury	
	Tetanus status	
PHYSICAL EXAM		
Observation	Position of finger	Abnormal cadence (fingers normally slightly flexed), scissoring
	Deformity	Bony protrusions or specific deformities (e.g. mallet, boutonniere, and swan neck deformity)
	Bruising or swelling	May indicate underlying skeletal injury
	Sweating pattern (usually felt more so than from observation)	May indicate denervation
	Anatomical structures beneath	If open laceration, need to explore within wound (under sterile conditions)
	Structure	Examination
Vascular Status	Radial and ulnar arteries	Allen's Test
	Digital arteries	Hard to palpate but you can assess capillary refill (<2-3 s)
	Temperature and skin turgor	For each test, need to compare both sides
Sensory (see Figure 3)	Median nerve	Dorsal radial tip of index finger
	Ulnar nerve	Dorsal ulnar tip of little finger
	Radial nerve	Dorsal web space of the thumb
	Digital nerves	2 point discrimination on both the radial and ulnar side of the DIPJ creases (static or moving 2 point discrimination)

Compartment Syndrome

Watch out for these signs with a closed or open injury: tense, painful extremity (worse on passive stretch), parasthesia/paralysis, pallor, distal pulselessness (often late in process), and contracture (irreversible ischemia)
Intracompartmental pressures can be measured (normal pressure = up to 12 mmHg), but a clinical diagnosis is an indication for an emergent fasciotomy; if untreated, end result is ischemic contracture of the extremity (Volkmann's contracture)

Figure 22. Testing profundus (FDP) – inserts at distal phalanx

Figure 23. Testing superficialis (FDS) – inserts at middle phalanx

Table 20. Key Features of the History and Physical Exam of the Injured Hand in the Emergency Department (continued)

	Structure	Examination
Motor Function	Median nerve	Flex DIP of index finger to test the anterior interosseus (AIN) branch of the median nerve Touch the tip of the index finger to the thumb trying to break through ("OK sign") Thumb to ceiling with palm up
	Ulnar nerve	Extrinsic muscles: flex DIP of little finger Intrinsic muscles: abduct index finger ("Peace sign") or patient able to hold piece of paper between adducted fingers and resist pulling
	Radial nerve	Extrinsic muscles: extend thumb ("thumb's up") and wrist
Range of Motion	Tendons, bones, joints, nerves	Assess active and passive range of motion of wrist extension/flexion/ulnar/radial deviation, finger abduction/adduction/flexion/extension, thumb flexion/extension/abduction/adduction/circumflexion
Tendons	FDP	Stabilize PIP in extension, ask patient to flex fingers (at DIP)
	FDS	Stabilize non-exam fingers in extension (neutralizes FDP) and ask patient to flex examination finger
Palpation	Bones	Focal tenderness or abnormal alignment
	Joints	Instability may indicate ligamentous injury or dislocation

Approach to Hand Lacerations

TIN AX

Tetanus prophylaxis
Irrigate with NS (copious irrigation and debridement in a timely manner)
NPO (NPO only if you are considering replanting, otherwise most operations are done as elective procedures)
Antibiotic prophylaxis (controversial – most require no ABx, mainly needed for animal bites)
X-rays

Allen's Test: You need to exsanguinate the hand by having the patient open and close the hand. Then, while patient's hand is firmly closed, occlude both radial and ulnar arteries. Once fist is open, release either artery and assess collateral flow

High pressure injection injury is deceptively benign-looking (small pinpoint hole on finger pad) often with few clinical signs. Intense pain and tenderness, along the course the foreign material travelled, is present a few hours after the injury. Definitive treatment is exposure and removal of foreign material

Hand Exam

- Never blindly clamp a bleeding vessel as nerves are often found in close association with vessels
- Never explore any volar hand wound in the ER
- Arterial bleeding from a volar digital laceration may indicate nerve laceration (nerves in digits are superficial to arteries)

General Management

Nerves

- test the nerve function BEFORE putting in local anesthesia
- direct repair for a clean injury within 14 d and without concurrent major injuries → otherwise secondary repair
- epineural repair of all digital nerves with minimal tension
- post-operative: dress wound, elevate hand and immobilize
- Tinel's sign (cutaneous percussion over the repaired nerve) produces paresthesias and defines level of nerve regeneration
 - Wallerian degeneration occurs in the first 2 wk, which is why there is no Tinel's sign till after this time period
 - a peripheral nerve regenerates at 1 mm/d
 - paresthesias felt at area of percussion because re-growth of myelin (Schwann cells) is slower than axonal re-growth → percussion on exposed free-end of axon generates paresthesia

Vessels

- often associated with nerve injury (anatomical proximity)
- control bleeding with direct pressure and hand elevation
- if digit devascularized, optimal repair within 6 h
- close skin then dress, immobilize, and splint hand with fingertips visible
- monitor colour, capillary refill, skin turgor, fingertip temperature post-revascularization

Tendons

- most tendon lacerations require primary repair
- many extensors are repaired in the emergency room, flexors are repaired in the operating room within 2 wk
- avoid excessive immobilization after repair (specific protocols for flexors, 2-3 wk for extensors) to minimize stiffness and facilitate rehabilitation

Bones

- see *Fractures and Dislocations*, PL25

Nailbed

- remove nail to examine underlying nailbed under digital block anesthesia
- irrigate wound and nail thoroughly
- suture repair of nailbed with chromic suture
- replace cleaned nail, which acts as splint for any underlying distal phalangeal fracture and prevents adhesion formation between nail fold and nailbed

Hand Infections

Principles

- trauma is most common cause
- 5 cardinal signs: *rubor* (red), *calor* (hot), *tumour* (swollen), *dolor* (painful) and *functio laesa* (loss of function)
- 90% caused by Gram-positive organisms
- most common organisms (in order) – *S. aureus*, *S. viridans*, Group A *Streptococcus*, *S. epidermidis*, and *Bacteroides melaninogenicus* (MRSA is becoming more common)

TYPES OF INFECTIONS

Deep Palmar Space Infections

- uncommon, there are 9 spaces in the hand, the most commonly involved are thenar or mid-palm space (treated in the OR)

Felon

- **definition:** subcutaneous abscess in the fingertip that commonly occurs following a puncture wound into the pad of digit; may be associated with osteomyelitis (akin to compartment syndrome and can lead to skin necrosis)
- **treatment:** elevation, warm soaks, cloxacillin 500 mg PO q6h (if in early stage); if obvious abscess or pressure on the overlying skin or failure to resolve with conservative measures, then needs I&D; take cultures/gram stain and PO cloxacillin

Flexor Tendon Sheath Infection

- *Staphylococcus* > *Streptococcus* > Gram-negative rods
- **definition:** acute tenosynovitis commonly caused by a penetrating injury and can lead to tendon necrosis and rupture if not treated; it is often suppurative; however, early on there can be very little pus
- **clinical features:** Kanavel's 4 cardinal signs
 1. point tenderness along flexor tendon sheath (earliest and the most sensitive and specific)
 2. severe pain on passive extension of DIP (second most important)
 3. fusiform swelling of entire digit
 4. flexed posture (increased comfort)
- **treatment**
 - OR incision and drainage, irrigation, IV antibiotics, and resting hand splint until infection resolves

Herpetic Whitlow

- HSV-1, HSV-2
- **definition:** painful vesicle(s) around fingertip
 - often found in medical/dental personnel and children
- **clinical features:** can be associated with fever, malaise and lymphadenopathy
 - patient is infectious until lesion has completely healed
- **treatment:** routine culture and viral prep protection (cover), consider oral acyclovir; do not break blisters, as this can spread infection

Paronychia

- acute = *Staphylococcus*; chronic = *Candida*
- **definition:** infection (granulation tissue) of soft tissue around fingernail (beneath eponychial fold)
- **etiology**
 - acute paronychia: a "hangnail", artificial nails, and nail biting
 - chronic paronychia: prolonged exposure to moisture
- **treatment**
 - acute paronychia: warm compresses and cephalexin 500 mg PO q6h if caught early and drainage if abscess present – can usually drain with a #11 blade directed into the abscess from underneath the paronychia fold
 - chronic paronychia: anti-fungals with possible debridement and marsupialization, removal of nail plate

Amputations

Hand or Finger

- emergency management: injured patient and amputated part require attention
 - **patient:** x-rays (stump and amputated part), NPO, clean wound and irrigate with NS, dress stump with nonadherent, cover with dry sterile dressing, tetanus and antibiotic prophylaxis (cephalosporin/erythromycin)
 - **amputated part:** x-rays, gently irrigate with RL, wrap amputated part in a NS/RL soaked sterile gauze and place inside waterproof plastic bag, place in a container, then place container on ice

indications for replantation

- **age:** children often better results than adults
- **level of injury:** proximal, thumb and multiple digit amputations are higher priority
- **nature of injury:** clean cut injuries have higher successful replantation rate; avulsion and crush injuries are relative contraindications to replant
- if replant contraindicated manage stump with revision amputation
 - would only allow a fingertip injury to heal by secondary intention

Tendons

Common Extensor Tendon Deformities

Table 21. Extensor Tendon Deformities

Injury	Definition	Zone	Etiology/Clinical Features	Treatment
Mallet Finger	DIP flexed with loss of active extension	1	There are bony and non-bony mallets Bony: Fracture of distal phalanx distal to tendon insertion Non-bony: Forced flexion of the extended DIP leading to extensor tendon rupture at DIP (e.g. sudden blow to tip of the finger)	Splint DIP in extension for 6 wk followed by 2 wk of night splinting; if inadequate improvement after 6 wk, check splinting routine and recommend 4 more wk of continuous splinting. If there is a bony component that is displaced the patient may require ORIF
Boutonniere Deformity	PIP flexed, DIP hyperextended	3	Injury or disease affecting the extensor tendon insertion into the dorsal base of the middle phalanx Associated with RA or trauma (laceration, volar dislocation, acute forceful flexion of PIP)	Splint PIP in extension and allow active DIP motion
Swan Neck Deformity	PIP hyperextended, DIP flexed	3	Trauma (PIP volar plate injury) Associated with RA and old, untreated mallet deformity	Splint to prevent PIP hyperextension or DIP flexion Consider arthrodesis/arthroplasty

A-2 and A-4 pulleys are most important for function; prevent bowstringing of tendons

Figure 24. Zone of extensor tendon injury (odd numbered zones fall over a joint)

Figure 25. (A) Mallet finger deformity (B) Boutonniere deformity (C) Swan neck deformity

De Quervain's Tenosynovitis (zone 7; most common cause of radial wrist pain)

- **definition:** inflammation in 1st extensor compartment (APL and EPB)
- **clinical features**
 - +ve Finkelstein's test (pain over the radial styloid induced by making fist, with thumb in palm, and ulnar deviation of wrist)
 - pain localized to the 1st extensor compartment
 - tenderness and crepitation over radial styloid may be present
 - differentiate from CMC joint arthritis (CMC joint arthritis will have a positive grind test, whereby crepitus and pain are elicited by axial pressure to the thumb)
- **treatment**
 - mild: NSAIDs, splinting and steroid injection into the tendon sheath (successful in over 60% of cases)
 - severe: surgical release of stenotic tendon sheaths (APL and EPB); remember there may be 2 or more sheaths

Ganglion Cyst

- **definition**
 - fluid-filled synovial lining that protrudes between carpal bones or from a tendon sheath; most commonly carpal in origin
 - most common soft tissue tumour of hand and wrist (60% of masses)
- **clinical features**
 - most common around scapholunate ligament junction
 - 3 times more common in women than in men
 - more common in younger individuals
 - can be large or small – may drain internally so size may wax and wane
 - often non-tender although tenderness increased when cyst smaller (from increased pressure within smaller cyst sac)

Figure 26. Zones of the flexor tendons

- **treatment**
 - conservative treatment: do nothing
 - aspiration (recurrence rate 65%)
 - consider operative excision of cyst and stalk (recurrence is possible)
 - steroids if painful (done in combination with aspiration)

Common Flexor Tendon Deformities

- flexor tendon zones (important for prognosis of tendon lacerations)
- “no-man’s land”
 - between distal palmar crease and mid-middle phalanx
 - zone where superficialis and profundus lie ensheathed together
 - recovery of glide very difficult after injury

Stenosing Tenosynovitis (trigger finger/thumb)

- **definition:** inflammation of synovium causes size discrepancy between tendon and sheath/pulley (most commonly at A-1 pulley) = locking of thumb or finger in flexion/extension
- **etiology:** idiopathic or associated with RA, DM, hypothyroidism and gout
- **clinical features**
 - thumb, ring and long fingers most commonly affected
 - patient complains of catching, snapping or locking of affected finger
 - tenderness to palpation/nodule at palmar aspect of MCP over A-1 pulley
 - women are 4 times more likely than men to be affected
- **conservative treatment**
 - NSAIDs
 - steroid injection
 - injections less likely to be successful in patients with DM or symptoms greater than 6 mo
 - splint
- **surgical treatment**
 - indicated if no relief of symptoms or minimal relief with steroids
 - incise A-1 flexor tendon pulley to permit unrestricted, full active finger motion

Grading classification for Stenosing Tenosynovitis

- Grade I (Pre-triggering)- Pain/tenderness over the A1 pulley with a hx of catching although not catching on exam
- Grade II (Active)- Demonstrable catching, but the patient can extend the finger
- Grade III (Passive)- Grade IIIa: catching requiring passive extension. Grade IIIb is the inability to actively flex
- Grade IV (Contracture)- Catching with a fixed flexion contracture of the proximal interphalangeal joint

Fractures and Dislocations

- for fracture principles, see [Orthopedics](#), OR4

FRACTURES

- about 90% of hand fractures are stable in flexion (splint to prevent extension)
- **position of function** (like a hand holding a pop can)
 - wrist extension 15°
 - MCP flexion 45°
 - IP flexion (slight)
 - thumb abduction/rotation
 - done if you wanted to immobilize a fracture but are were unsure if there were other injuries
 - contraindications: post repair of flexor tendons, median/ulnar nerve injury
- stiffness secondary to immobilization is the most important complication; Tx = early motion

Distal Phalanx Fractures

- most commonly fractured bone in the hand
- usual mechanism is crush injury and thus accompanied by soft tissue injury
- subungual hematoma is common and must be decompressed if painful by removing the nail
- treatment consists of 3 wk of digital splinting (with IP joint movement preserved)

Proximal and Middle Phalanx Fractures

- check for: rotation, scissoring (overlap of fingers on making a fist), shortening of digit
- undisplaced or minimally displaced: closed reduction (if extra-articular) buddy tape to neighbouring stable digit, elevate hand, motion in guarded fashion early, splinted for 2-3 wk
- displaced, non-reducible, not stable with closed reduction, or rotational or scissoring deformity: percutaneous pins (K-wires) or ORIF, and splint

Metacarpal Fractures

- generally accept varying degrees of deviation before reduction required: up to 10° (D2), 20° (D3), 30° (D4), or 40° (D5)
- **Boxer's fracture (extra-articular):** acute angulation of neck of metacarpal of little finger into palm
 - mechanism: blow on the distal-dorsal aspect of closed fist
 - loss of prominence of metacarpal head, volar displacement of head
 - check for scissoring of fingers on making a fist
 - up to 30-40° angulation may be acceptable
 - closed reduction should be considered to decrease the angle
 - if stable ulnar gutter splint for 2-3 wks

Figure 27. Position of function

Figure 28. Position of safety

Figure 29. Boxer's fracture

- **Bennett's fracture (intra-articular):** fracture/dislocation of the base of the thumb metacarpal
 - unstable fracture
 - abductor pollicis longus pulls MC shaft proximally and radially causing adduction of thumb
 - treat with percutaneous pinning, thumb spica x 6 wk
- **Rolando's fracture (intra-articular):** T- or Y-shaped fracture of the base of the thumb metacarpal
 - treated like a Bennett's fracture

DISLOCATIONS

- must be reduced as soon as possible
- dislocation vs. subluxation
 - dislocation: severe injury where articular surfaces of a joint are no longer in contact with one another
 - subluxation: articular surfaces of a joint are partially out of place, but then go back into place (partial dislocation, often unstable)

PIP and DIP Dislocations (PIP more common than DIP)

- usually dorsal dislocation (commonly from hyperextension)
- if closed dislocation: closed reduction and splinting (30° flexion for PIP and full extension for DIP) or buddy taping and early mobilization (prolonged immobilization causes stiffness)
- open injuries are treated with wound care, closed or open reduction, irrigation and debridement, and antibiotics

MCP Dislocations (relatively rare)

- dorsal dislocations much more common than volar dislocations
- dorsal dislocation of proximal phalanx on metacarpal head; most commonly index finger (hyperextension)
- two types of dorsal dislocation
 - simple (reducible with manipulation): treat with 2-4 wk of splinting at 30° MCP flexion
 - complex (volar plate blocks reduction): treat with open reduction and A1 pulley release + extension-blocking splint at 30° flexion (2 wk) then 10° flexion (2 wk)

Ulnar Collateral Ligament (UCL) Injury

- forced abduction of thumb (e.g. ski pole injury)
- **skier's thumb:** acute UCL injury
- **gamekeepers thumb:** chronic UCL injury
- **evaluation:** radially deviate thumb MCP joint in full extension and at 30° flexion and compare with non-injured hand. UCL rupture is presumed if injured side deviates more than 30° in full extension or more than 15° in flexion
- **Stener's lesion:** the UCL has bony attachments to the adductor aponeurosis and the proximal ligament can displace while the distal attachment remains deep to the aponeurosis, forming a barrier that blocks healing and leads to chronic instability; requires surgery

Figure 30. Bennett's fracture

Figure 31. Rolando's fracture

Dupuytren's Disease

Definition

- contraction of longitudinal palmar fascia, forming nodules (usually painless), fibrous cords and eventually flexion contractures at the MCP and interphalangeal joints
- flexor tendons not involved
- Dupuytren's diathesis: early age of onset, strong family history, and involvement of sites other than palmar aspect of hand

Epidemiology

- genetic disorder, unusual in patients from African and Asian countries, high incidence in northern Europeans, men > women, often presents in 5th-7th decade of life, associated with but not caused by alcohol use and DM

Clinical Features

- order of digit involvement (most common to least common): ring > little > long > thumb > index
- may also involve feet (Ledderhose's) and penis (Peyronie's – see [Urology](#), U30)

Treatment

- stages
 1. palmar pit or nodule: no surgery
 2. palpable band/cord with no limitation of extension of either MCP or PIP: no surgery
 3. lack of extension at MCP or PIP: surgical fasciectomy indicated
 4. irreversible periarticular joint changes/scarring: surgical treatment possible but poorer prognosis compared to stage 3

Figure 32. Dupuytren's disease

- indications for percutaneous release
 - functional impairment
 - MCP contractures $>30^\circ$
 - any PIP contracture
 - rapidly progressive disease
- may recur, especially in Dupuytren's diathesis

Carpal Tunnel Syndrome

Definition

- median nerve compression at the level of the flexor retinaculum as opposed to pronator teres syndrome (compressive neuropathy at the level of the elbow)

Etiology

- median nerve entrapment at wrist
- primary cause is idiopathic
- secondary causes: space occupying lesions (tumours, hypertrophic synovial tissue, fracture callus, and osteophytes), metabolic and physiological (pregnancy, hypothyroidism, acromegaly, and RA), infections, neuropathies (associated with DM or alcoholism), and familial disorders
- job/hobby related repetitive trauma, especially forced wrist flexion

Epidemiology

- female:male = 4:1, most common entrapment neuropathy

Clinical Features

- sensory loss in median nerve distribution (see Figure 4)
- discriminative touch often lost first
- classically, patient awakened at night with numb/painful hand, relieved by shaking/dangling/rubbing
- decreased light touch and 2-point discrimination, especially fingertips
- advanced cases: thenar wasting/weakness due to involvement of the motor branch of the nerve
- \pm Tinel's sign (tingling sensation on percussion of nerve)
- \pm Phalen's sign (wrist flexion induces symptoms)

Investigations

- clinical diagnosis
- NCV and EMG may confirm, but do not exclude, the diagnosis

Treatment

- avoid repetitive wrist and hand motion, wrist splints at night and when repetitive wrist motion required
- conservative: night time splinting to keep wrist in neutral position
- medical: NSAIDs, local corticosteroids injection, oral corticosteroids
- surgical decompression: transverse carpal ligament incision to decompress median nerve
- indications for surgery: numbness and tingling \pm sensory loss, weakness \pm muscle atrophy, unresponsive to conservative measures
- complications of surgery: injury to median motor branch, palmar cutaneous branch or superficial transverse vascular arch, local pain (pillar pain), and scar formation

Rheumatoid Hand

- see [Rheumatology](#), RH8

Brachial Plexus

Etiology

- common causes of brachial plexus injury: complication of childbirth and trauma
- other causes of injury: compression from tumours, ectopic ribs

Common Palsies

Table 22. Named Neonatal Palsies of the Brachial Plexus

Palsy	Location of Injury	Mechanism of Injury	Features
Duchenne-Erb Palsy	Upper brachial plexus (C5-C6)	Head/shoulder distraction (e.g. motorcycle)	"Waiter's tip deformity" (shoulder internal rotation, elbow extension, wrist flexion)
Klumpke's Palsy	Lower brachial plexus (C7-T1)	Traction on abducted arm	"Claw hand" May include Horner's syndrome

Accuracy of the Clinical Assessment for Carpal Tunnel Syndrome

- Phalen's:
 - Sensitivity: 0.75 Specificity: 0.47
- Tinel's:
 - Sensitivity: 0.60 Specificity: 0.67
- Carpal Tunnel Compression Test:
 - Sensitivity: 0.87 Specificity: 0.90

Hand Surgery Update 1996;223

Development and Validation of Diagnostic Criteria for Carpal Tunnel Syndrome

J Hand Surg 2006;31:919-924

Purpose: To develop a clinical diagnostic criteria for carpal tunnel syndrome that modeled the clinical diagnostic practices of experts.

Methods: Out of 57 clinical findings associated with CTS, eight were ranked highly by a panel of expert clinicians. Using 256 case histories, a panel of experts decided whether a case did or did not have a diagnosis of CTS. This diagnosis represented the dependent variable for a logistic regression model, to which the eight clinical findings were applied. The regression model was then validated against the consensus of a second panel on the diagnosis of CTS for the case histories.

Results/Conclusions: The correlation between the probability of CTS predicted by the regression model and the panel of clinicians was 0.71. Clinical diagnostic criteria that contributed significantly to the model were:

1. Numbness and tingling in median nerve distribution
2. Nocturnal numbness
3. Weakness and/or atrophy of the thenar musculature
4. Tinel's sign
5. Phalen's test
6. Loss of 2-point discrimination

A Cochrane Review looked at non-surgical management of carpal tunnel and found that there is significant short-term benefit from oral steroids, splinting, ultrasound, yoga, and carpal bone mobilization. Cochrane Database Systematic Review 2003: CD003219

Radiographic Evolution of the Rheumatoid Hand

Earliest Sign: erosion of the ulnar styloid

Progression: characterized by symmetrical joint space narrowing and erosions of the carpal bones, MCP and PIP (with DIP relatively spared)

Late Stage: Swan neck and Boutonniere deformities

Differential Diagnosis of Adult Acquired Brachial Plexus Palsies

- trauma (blunt, penetrating)
- thoracic outlet syndrome
 - neurogenic: associated with cervical rib; compression of C8/T1
 - vascular: pain or sensory symptoms without cervical rib; cessation of radial pulse with provocative maneuvers
- tumour
 - schwannoma: well-defined margins makes it easier for total resection
 - neurofibromas: associated with neurofibromatosis type I
 - other: e.g. Pancoast syndrome (apical lung tumour)
- neuropathy (compressive, post-irradiation, viral, diabetic, idiopathic)

Investigations

- EMG
- MRI: gold standard for identifying soft tissue masses
- CT myelogram: controversial, although some people think that it is better than MRI for identification of nerve root avulsion and identification of pseudomeningocele. Important for pre-operative identification of patients likely to require neurotisation procedures (especially for patients with blunt trauma)
- timing for investigations and surgery is important. First studies are likely not done until 6 wk after a closed injury; however, any open injury will go to the OR for immediate exploration

Management

Table 23. Management of Brachial Plexus Injuries

	Type	Treatment
Non-Penetrating Trauma	Concussive/compressive	Usually improves (unless expanding mass, e.g. hematoma)
	Traction/stretch	If no continued insult, follow for 3-4 mo for improvement
	Obstetric palsy	Surgery if no significant improvement and/or residual paresis at 6 mo of age
Penetrating Trauma	Sharp or vascular injury	Explore immediately in OR

Craniofacial Injuries

- low velocity vs. high velocity injuries determine degree of damage
- fractures cause bruising, swelling and tenderness → loss of function
- frequency: nasal > zygomatic > mandibular > maxillary
- management: can wait 5-10 d for swelling to decrease before ORIF required

Approach to Facial Injuries

- ATLS protocol
- inspect, palpate, clinical assessment for injury to underlying structures (e.g. facial nerve)
- tetanus prophylaxis
- radiological evaluation
- wound irrigation with NS/RL and remove foreign materials
- conservative debridement of detached or nonviable tissue
- repair when patient's general condition allows (soft tissue injury: <8 h preferable)
- suspect C-spine injury with any facial trauma. C-spine evaluation should be done before radiographs are ordered
- consider intracranial trauma; rule out skull fracture

Investigations

- CT
 - axial and coronal (specifically request 1.5 mm cuts): for fractures of upper and middle face
 - indicated for significant head trauma, complex facial fractures, orbital floor, panface fractures, pre-operative assessment
- panorex radiograph: shows entire upper and lower jaw; best for isolated mandible fracture but patient must be able to sit

Patients with major facial injuries are at risk of developing upper airway obstruction (displaced blood clots, teeth or fracture fragments; swelling of pharynx and larynx; loss of support of hyomandibular complex → retroposition of tongue); also at risk of ocular injury

Signs of Basal Skull Fracture

- Battle's sign (bruised mastoid process)
- Hemotympanum
- Raccoon eyes (periorbital bruising)
- CSF otorrhea/rhinorrhea

Facial bone injuries with globe involved require ophthalmology consult

Table 24. Imaging of the Craniofacial Skeleton

Structure	Appropriate Imaging
Mandible	Panoramic (panorex) CT
Zygomatic and orbital bones	CT scan
Nasal bones	No x-ray required – clinical
Maxilla	CT scan – axial and coronal

Treatment Goals

- consultation when indicated (dentistry, ophthalmology)
- re-establish normal occlusion if occlusion is an issue
- pursue normal eye function (extraocular eye movements and vision)
- restore stability of face and appearance

Complications

- complications are dependent on the surgery and injury. Not all complications apply to all situations
- diplopia/enophthalmos/blindness
- intracranial pathology such as CSF leak, bleeding and SIADH (secondary to trauma, not the surgery itself)
- sinusitis
- functional abnormalities (i.e. malocclusion)
- infection – extremely rare
- poor cosmesis; need for 2^o surgery

Mandibular Fractures

- always two points of injury since it is a ring structure (includes fractures and dislocations)
- commonly at sites of weakness (condylar neck, angle of mandible, region of 3rd molar or canine tooth)

Etiology

- anterior force: bilateral fractures
- lateral force: ipsilateral subcondylar and contralateral angle or body fracture
- note: classified as open if fracture into tooth bearing area (alveolus)

Clinical Features

- pain, swelling, difficulty opening mouth (“trismus”)
- malocclusion, asymmetry of dental arch
- damaged, loose, or lost teeth
- palpable “step” along mandible
- numbness in V3 distribution
- intra-oral lacerations or hematoma (sublingual)
- chin deviating toward side of a fractured condyle

Classification

Table 25. Mandibular Fracture Classifications by Anatomic Region

	Areas/Boundaries
Symphysis	Midline of the mandible; between the central incisors from the alveolar process through the inferior border of the mandible
Body	From the symphysis to the distal alveolar border of the third molar
Angle	Triangular region between the anterior border of the masseter and the posterosuperior insertion of the masseter distal to the third molar
Ramus	Part of the mandible that extends posteriosuperiorly into the condylar and coronoid processes
Condylar*	Area of condylar process of mandible
Subcondylar	Area below the condylar neck (i.e. sigmoid notch) of the mandible
Coronoid Process	Area of the coronoid process of mandible

*Most common mandibular fracture type

Figure 33. Mandibular fracture

Treatment

- maxillary and mandibular arch bars wired together (intramaxillary fixation) or ORIF
- antibiotics to cover against *S. aureus* and anaerobes

Complications

- malocclusion, malunion
- tooth loss, and possible sensation loss
- TMJ ankylosis

Maxillary Fractures

Table 26. Le Fort Classification

	Le Fort I	Le Fort II	Le Fort III
Alternative Name	Guérin fracture	Pyramidal fracture	Craniofacial dysjunction
Type of Fracture	Horizontal	Pyramidal	Transverse
Structures Involved	Piriform aperture Maxillary sinus Pterygoid plates	Nasal bones Medial orbital wall Maxilla Pterygoid plates	Nasofrontal suture Zygomatofrontal suture Zygomatic arch Pterygoid plates
Anatomical Result	Maxilla divided into 2 segments	Maxillary teeth separated from upper face	Detach entire midfacial skeleton from cranial base

Nasal Fractures

Etiology

- lateral force → more common, good prognosis
- anterior force → can produce more serious injuries
- most common facial fracture

Clinical Features

- epistaxis/hemorrhage, deviation/flattening of nose, swelling, periorbital ecchymosis, tenderness over nasal dorsum, crepitus, septal hematoma, respiratory obstruction, subconjunctival hemorrhage
- depression and splaying of nasal bones causing a saddle deformity
- important to clinically assess for naso-orbital ethmoid fractures

Treatment

- treated for airway or cosmetic issues
- closed reduction with Asch or Walsham forceps under anesthesia, pack nostrils with petroleum or non-adhesive gauze packing, nasal splint for 7 d
- best reduction immediately (<6 h) or when swelling subsides (5-7 d)
- rhinoplasty may be necessary later for residual deformity (30%)

Naso-Orbital Ethmoid Fractures

Etiology

- fractures of the nasal and ethmoid bones of the medial orbit
- problematic and may lead to change in facial appearance
- Markowitz-Manson classification:
 - Type 1: Single, central fragment, medial canthal ligament intact
 - Type 2: Comminuted central fragment, medial canthal ligament intact
 - Type 3: Severe comminution of central fragment and disrupted medial canthal ligament

Clinical Presentation

- telecanthus defined as increased intercanthal distance secondary to medial canthal ligament disruption
- orbital rim step-off

Treatment

- surgical repair to restore intercanthal distance (reverse telecanthus), nasal projection and orbital anatomy

Figure 34. Le Fort fractures

Always drain septal hematomas as this is a cause of septal necrosis with perforation (saddle nose deformity)

Zygomatic Fractures

- classification
 1. fracture restricted to zygomatic arch
 2. depressed fracture of zygomatic complex (zygoma)
 3. unstable fracture of zygomatic complex (tetrapod fracture) – separations occur at maxilla, frontal bone, temporal bone and orbital rim

Clinical Features

- flattening of malar prominence (view from above)
- pain over fractures on palpation
- numbness in V2 distribution (infraorbital and superior dental nerves)
- palpable step deformity in bony orbital rim (especially inferiorly)
- often associated with fractures of the orbital floor
- ipsilateral epistaxis; trismus

Treatment

- if undisplaced, stable and no symptoms, then soft diet; no treatment necessary
- ophthalmologic evaluation if suspected globe injury
- undisplaced zygomatic arch fractures can be elevated using Gillies approach: leverage on the anterior part of the zygomatic arch via a temporal incision; stabilization often unnecessary
- ORIF for displaced or unstable fractures of zygomatic complex

Figure 35. Zygomatic fractures

Orbital Floor Fractures

- see [Ophthalmology](#), OP43

Definition

- fracture of floor of orbit ± intact infraorbital rim
- may be associated with nasoethmoid fracture

Etiology

- blunt force to eyeball → sudden increase in intra-orbital pressure (e.g. baseball or fist)

Clinical Features

- **check visual fields and acuity for injury to globe**
- periorbital edema and bruising, subconjunctival hemorrhage
- ptosis, exophthalmos, exorbitism, or enophthalmos
- orbital rim step-offs with possible infraorbital nerve anesthesia
- vertical dystopia (abnormal displacement of the entire orbital cone in the vertical plane); diplopia looking up or down (entrapment of inferior rectus), limited EOM
- orbital entrapment
 - clinical diagnosis that is a surgical emergency
 - diplopia with vertical gaze; limited EOM
 - severe pain or nausea and vomiting with upward globe movement
 - requires urgent ophthalmology evaluation and surgical repair

Investigations

- CT (diagnostic): axial and coronal views
- diagnostic manoeuvre for entrapment is **forced duction** test (pulling on inferior rectus muscle with forceps to ensure full ROM) under anesthesia in the OR

Treatment

- surgical repair indicated if: urgent repair for entrapment, floor defect >1 cm, any size defect with enophthalmos or persistent diplopia (>10 d)
- reconstruction of orbital floor with bone graft or alloplastic material
- ophthalmologic evaluation suggested

Complications

- persistent diplopia
- enophthalmos

Superior Orbital Fissure Syndrome

- fracture of SOF causing ptosis, proptosis, anesthesia in V1 distribution, and painful ophthalmoplegia (paralysis of CN III, IV, VI)
- uncommon complication seen in Le Fort II and III fractures (1/130)
- recovery time reported as 4.8-23 wk following operative reduction of fractures

Orbital Apex Syndrome

- fracture through optic canal with involvement of CN II at apex of orbit
- symptoms are the same as SOF syndrome plus vision loss
- treatment is urgent decompression of fracture in optic canal (posterior craniotomy for decompression) or steroids

Figure 36. Blow-out fracture

Breast Surgery

Breast Reconstruction

- important consideration in breast cancer treatment
- two basic methods: implants (1-stage or 2-stage) or autologous tissue
- may also require breast balancing procedure and nipple areola reconstruction

Pre-Reconstruction Considerations

- radiation: treatment before and after mastectomy is a relative contraindication to alloplastic reconstruction
- recipient tissue: skin sparing mastectomy allows for the use of implants without tissue expanders
- donor tissue: limited availability of suitable donor tissue (lack of tissue, scar, previous surgery that interferes with blood supply) may prevent the use of autologous tissue reconstruction
- timing (immediate vs. delayed)
- contralateral breast: may not be possible to reconstruct a breast of the same size or shape as the contralateral breast. Breast reduction or mastopexy may be considered in opposite breast (see Table 28)
- other considerations: patient's comorbidities, prognosis, body weight, characteristics of chest wall and patient's attitude

Table 27. Options for Breast Reconstruction

Procedure	Definition	Surgical Details	Other Comments
Alloplastic (Implant based)	Use of synthetic material (silicone or saline implants)	<p><i>With expanders</i> (2 stages): Use tissue expanders before replacement with implants to help facilitate breast ptosis</p> <p><i>Without expanders</i> (1 stage): In skin-sparing mastectomy, enough skin is available for immediate placement of implant. The limiting factor, however, is the muscle as the implant must fit under the pectoralis (may require acellular dermal matrix if implant size and muscle size is a mismatch)</p>	Complications: capsular contraction (foreign body reaction to implants), rupture or leakage of implant, increased risk of infection, 35% revision rate over 5 yr
Autologous Tissue	Use of patient's own tissue	Many flap options: DIEP, TRAM, latissimus dorsi, SIEA, SGAP, and IGAP	Offers natural consistency
Nipple Areola Reconstruction	Final stage of breast reconstruction	<p>Local vs. distant flap/graft:</p> <ol style="list-style-type: none"> 1. Local: fish tail, skate, top hate, double opposing etc.; these flaps allow simultaneous nipple and areola reconstruction 2. Distant: opposite nipple, earlobe, abdominal skin, costal cartilage, labia 	Usually performed 3 mo post-reconstruction

Patients may require a balancing procedure on contralateral side

Nipple innervation is T4

Breast Tissue Expanders

- types: textured vs. smooth, both with integrated port
- placement: sub-pectoral, total submuscular (pectoral/serratus)
- size: depends on contralateral breast and desired size
 - generally over-expanded to facilitate ptosis
- timing of expansion: begins when wound fully healed (usually 2 wk post-operative), and tissue expanders are inflated weekly or bi-weekly until complete (up to 3 mo); expanders are exchanged for implants after another 3 mo for consolidation of expanded skin

Arterial blood supply to the breast

- internal thoracic*
- external thoracic*
- lateral thoracic
 - thoracoacromial
 - intercostals
 - thoracodorsal

* also provide arterial blood supply to nipple-areola complex

Figure 37. Augmentation mammoplasty: incision lines and implant placement

Breast Reduction

- reduction mammoplasty performed for relief of physical symptoms (e.g. shoulder groove, neck pain, back pain, shoulder pain, mastodynia)
- key steps of procedure include preoperative landmarks, design of pedicle, nipple preservation, tissue resection, breast reshaping, setting nipple at aesthetic landmark, and tension free closure
 - incisions: circular around the areola, vertical from areola incision to infra-mammary fold, along the natural infra-mammary fold (this incision is for a wise pattern reduction, although many other types exist)
 - removal of fat, breast tissue, and excess skin
 - need to move nipple and areola complex to higher position
- complications: infection, hemorrhage, decreased nipple sensation, inability to breast feed, breast/nipple asymmetry, nipple loss (partial or complete), skin loss/necrosis, fat necrosis

Aesthetic Surgery

Aesthetic Procedures

Table 28. Aesthetic Procedures

Location	Procedure	Description
Head/Neck	Hair transplants	Aesthetic improvement of hair growth patterns using grafts or flaps
	Otoplasty	Surgical correction of protruding ears
	Brow lift	Surgical procedure to lift low brows
Face	Rhytidectomy	Surgical procedure to reduce wrinkling and sagging of the face and neck; "face lift"
	Blepharoplasty	Surgical procedure to shape or modify the appearance of eyelids by removing excess eyelid skin \pm fat pads
	Rhinoplasty	Intranasal surgical reconstruction of the nose
	Genioplasty	Chin augmentation via osteotomy or synthetic implant to improve contour
	Lip augmentation	Procedure to create fuller lips and to reduce wrinkles around the mouth using collagen injections, fat transferred from other body parts, or implantable materials
Skin	Chemical peel	Application of one or more exfoliating agents to the skin resulting in destruction of portions of the epidermis and/or dermis with subsequent tissue regeneration
	Dermabrasion	Skin re-surfacing with a rapidly rotating abrasive tool; often used to reduce scars, irregular skin surfaces and fine lines
	Laser resurfacing	Application of laser to the skin which ultimately results in collagen reconfiguration and subsequent skin shrinking and tightening; often used to reduce scars and wrinkles
	Injectable fillers	An injectable substance is used to decrease frown lines, wrinkles, and nasolabial folds; substances include collagen, fat, hyaluronic acid, and calcium hydroxyapatite
Other	Abdominoplasty	Removal of excess skin and repair of rectus muscle laxity (rectus diastasis); "tummy tuck"
	Breast augmentation	Surgical breast enhancement with silicone or saline implants
	Calf augmentation	Augmentation of calf muscle with implants
	Liposuction	Surgical removal of adipose tissue for body contouring (not a weight loss procedure)
	Mastopexy	Surgical breast lift to elevate breast mound and tighten the skin envelope in ptotic breasts
	Sclerotherapy	Injection with a sclerosant to treat telangiectasias and varicose veins
	Gynecomastia	Excessive development of male mammary glands Treated with traditional or ultrasound-assisted liposuction

Pediatric Plastic Surgery

Craniofacial Anomalies

Table 29. Pediatric Craniofacial Anomalies

	Definition	Epidemiology	Clinical Features	Treatment
Cleft Lip	Failure of fusion of maxillary and medial nasal processes M:F = 2:1	1 in 1,000 live births (1 in 800 Caucasians, increased in Asians, decreased in Blacks) More common on the left (cleft of left lip/palate in boys has hereditary component)	Classified as incomplete/complete and uni/bilateral 2/3 cases: unilateral, left-sided, male	Surgery (3 mo): Millard, Tennison-Randall, or Fisher subunit repair corrections usually required later on (especially for nasal deformity)
Cleft Palate	Failure of fusion of lateral palatine/median palatine processes and nasal septum	Isolated cleft palate: 0.5 per 1,000 (no racial variation) F > M	Classified as incomplete/complete and uni/bilateral Isolated (common in females) or in conjunction with cleft lip (common in males)	Special bottles for feeding Speech pathologist Surgery (6-9 mo): Von Langenbeck or Furlow Z-Plasty ENT consult – often recurrent otitis media, requiring myringotomy tubes
Craniosynostosis	Premature fusion of ≥ 1 cranial sutures Primary – abnormal suture, no known cause This may limit brain growth perpendicular to the suture and cause compensatory growth parallel to the fused suture	1 in 2,000 live newborns; M:F = 52:48 Syndromes include: Crouzon's, Apert's, Saethre-Chotzen, Carpenter's, Pfeiffer's Jackson-Weiss and Boston-type syndromes	Syndromic – associated with genetic mutation Secondary (to microcephaly, hyperthyroid, rickets, etc.) Dx: irregular head shape, craniofacial abnormalities, x-ray	Multidisciplinary team (including neurosurgery, ENT, genetics, dentistry, pediatrics, SLP) The type, timing and procedure are dependent on which sutures (lambdoid, sagittal etc.) are involved. Early surgery prevents secondary deformities \uparrow ICP is an indication for emergent surgery ICU bed may be required post-surgically

Congenital Hand Anomalies

Table 30. American Society for Surgery of the Hand (ASSH) Classification of Congenital Hand Anomalies

Classification	Example	Features	Treatment
Failure of Formation	Transverse absence (congenital amputation)	At any level (often below elbow/wrist)	Early prosthesis
	Longitudinal absence (phocomelia)	Absent humerus Thalidomide association	
	Radial deficiency (radial club hand)	Radial deviation Thumb hypoplasia M > F	Physiotherapy + splinting Soft tissue release if splinting fails Distraction osteogenesis (Ilizarov) \pm wedge osteotomy Tendon transfer Pollicization
	Thumb hypoplasia	Degree ranges from small thumb with all components to complete absence	Depends on degree – may involve no treatment, webspace deepening, tendon transfer, or pollicization of index finger
	Ulnar club hand	Rare, compared to radial club hand Stable wrist	Splinting and soft-tissue stretching therapies Soft-tissue release (if above fails) Correction of angulation (Ilizarov distraction)
	Cleft hand	Autosomal dominant Often functionally normal (depending on degree)	First web space syndactyly release Osteotomy/tendon transfer of thumb (if hypoplastic)

Table 30. American Society for Surgery of the Hand (ASSH) Classification of Congenital Hand Anomalies (continued)

Classification	Example	Features	Treatment
Failure of Differentiation/ Separation	Syndactyly	Fusion of ≥ 2 digits 1/3,000 live births M:F = 2:1 Classified as partial/complete Simple (skin only) vs. complex (osseous or cartilaginous bridges)	Surgical separation before 6-12 mo of age May require a skin graft to cover the fingers Usually good result
	Symbrachydactyly	Short fingers with short nails at fingertips	Digital separation Webspace deepening
	Camptodactyly	Congenital flexion contracture (usually at PIP, especially 5th digit)	Early splinting Volar release Arthroplasty (rarely)
	Clinodactyly	Radial or ulnar deviation Often middle phalanx	None (usually); if severe, osteotomy with grafting
Duplication	Polydactyly	Congenital duplication of digits May be radial (increased in Aboriginals and Asians) or central or ulnar (increased in Blacks)	Amputation of least functional digit Usually > 1 yr of age (when functional status can be assessed)
Overgrowth	Macroductyly	Rare	None (if mild) Soft tissue/bony reduction
Undergrowth	Brachydactyly	Short phalanges	Removal of non-functional stumps Osteotomies/tendon transfers Distraction osteogenesis Phalangeal/free toe transfer
	Symbrachydactyly Brachysyndactyly	Short webbed fingers	As above + syndactyly release
Constriction Band Syndrome	i.e. amniotic (annular) band syndrome	Variety of presentations	Urgent release for acute, progressive edema distal to band in newborn Other reconstruction is case-specific
Generalized Skeletal Abnormality	Achondroplasia, Marfan's, Madelung's	Variety of presentations	Treatment depends on etiology

Public Health Context

- see [Ethical, Legal, and Organizational Medicine](#), ELOAM2 Overview of Canadian Healthcare System for the organization of health care in Canada including the legal foundation and historical context

Definitions

- population health**
 - health of the population as measured by health status indicators (e.g. life expectancy, low birth weight rates)
 - influenced by: physical, biological, social, environmental, and economic factors; personal health behaviours; health care services
 - refers to the prevailing or desired level of health in the population of a specific country/region/subset of population
 - considered to be more complex than the aggregate health status of individuals within a population
- public health**
 - organized collective efforts of society to protect, promote, and restore the health of the public and prevent illness, injury, and premature death
 - refers to the practices, programs, policies, institutions, and disciplines required to achieve the desired state of population health
- epidemiology**
 - study of the distribution and determinants of health-related states or events in a specified populations
 - application of this study to the control of health problems
- public health and preventive medicine** (formerly called community medicine)
 - the postgraduate study of health and disease in the population or a specified community
 - five-year Royal College specialty training
 - goal: to identify and address health problems and evaluate the extent to which health services and others address these issues (see <http://www.royalcollege.ca> for more information)

Public Health Services in Canada

Mission: to promote and protect the health of Canadians, and reduce health inequities through leadership, partnership, innovation, and action in public health

- local public health units and services within regional health authorities (in most provinces except Ontario, where local public health units are either autonomous or within local government) provide programs and activities for health protection, promotion, and disease prevention at local and regional levels
- catchment-area populations range from hundreds to thousands of people, covering areas of 15 km² to 1.5 million km²
- the "core functions" of public health include six essential activities:
 - health protection:** ensure safe water, air, and food; advise on food and drug safety regulations; maintain regulatory framework for control of infectious diseases and protection from environmental threats
 - health surveillance:** using routinely collected health data to monitor and predict health events or determinants
 - disease and injury prevention:** reduce risk of infectious disease by investigation, partner notification, and development of preventative and control measures such as immunization programs; reduce preventable illness and injuries by promoting safe, healthy lifestyles
 - population health assessment:** understand the health of communities/specific population to produce better policies and services
 - health promotion:** maintain and improve health through public policy, community-based interventions, active public participation, and advocacy
 - emergency preparedness and response:** planning for natural (e.g. floods, earthquakes) and man-made (e.g. radioactive substances) threats

Preparing for the LMCC

The AFMC Primer on Population Health is the core text for the LMCC and is available as an online resource on the AFMC website (<http://phprimer.afmc.ca>) For the LMCC exam, it is recommended that you also read Chapter 15 in Shah CP. Public health and preventive medicine in Canada, 5th ed. Toronto: Elsevier, 2003

Historical Perspective

Over the last century, Public Health has evolved through three main epidemiological phases:

- Infectious diseases:** controlled in the more developed world but an issue in less developed countries (e.g. polio, malaria)
- Chronic diseases:** chronic diseases and other noncommunicable conditions have increased morbidity and mortality (e.g. heart disease and cancer due to risk factors and/or exposures)
- Re-emerging infectious diseases:** new or re-emergent infections emerge due to unfamiliar or new pathogens, inefficient or inappropriate antibiotic use, travel, and global warming (e.g. HIV, drug resistant TB and malaria)

CPHO of Canada

- Responsible for the PHAC and reports to the Minister of Health
 - As the federal government's lead public health professional, provides advice to the Minister of Health and Government of Canada on health issues
 - Collaborates with other governments, jurisdictions, agencies, organizations, and countries on health matters
 - Communicates public health information to health professionals, stakeholders, and the public
 - In an emergency, such as an outbreak or natural disaster, provides direction to PHAC staff, including medical professionals, scientists, and epidemiologists, as they plan and respond to the emergency
- Source: Public Health Agency of Canada. <http://www.phac-aspc.gc.ca/cpho-acsp/cpho-acsp-role-eng.php>

Legislation and Public Health in Canada

Table 1. Legislation and Public Health in Canada

Federal	Provincial	Municipal (Ontario)
<ul style="list-style-type: none"> Health Canada <ul style="list-style-type: none"> Provides health services to First Nations, Aboriginal peoples, the Canadian military, and veterans Approves new drugs and medical devices Canadian Food Inspection Agency <ul style="list-style-type: none"> Monitors food products Deals with animal-related infections Regulates food labeling Public Health Agency of Canada (main Government of Canada agency responsible for public health) <ul style="list-style-type: none"> An independent body created to strengthen public health capacity Focuses on preventing chronic diseases, preventing injuries, and responding to public health emergencies and infectious disease outbreaks Oversees immigration screening, protects Canadian borders (e.g. airport health inspection) Liaises with the World Health Organization (WHO) on global health issues 	<ul style="list-style-type: none"> Legislation is in the form of Acts and Regulations Each province has its own Public Health Act or equivalent (e.g. the <i>Health Protection and Promotion Act</i> in Ontario) <ul style="list-style-type: none"> Designates the creation of geographic areas for the provision of public health services Gives powers to the Chief Medical Officer of Health to control public health hazards Specifies infectious diseases to be reported to public health units by physicians, laboratories, and hospitals (see Appendix, PH25) Has the ability to mandate programs that address public health issues, environmental health, and chronic disease prevention 	<ul style="list-style-type: none"> Local boards of health deliver programs mandated by provincial and municipal or regional legislation Boards of health are responsible for the delivery of most public health services, such as: <ul style="list-style-type: none"> Infectious disease control, including the follow-up of reported diseases and management of outbreaks Inspection of food premises including those in hospitals, nursing homes, and restaurants Family health services including pre-conception, preschool, school-aged, and adult health programs Tobacco control legislation enforcement Assessment and management of local environmental health risks Collection and dissemination of local health status reports Public dental health services to children By-laws may be approved by municipal governments to facilitate public health issues

Medical Officer of Health (MOH) (Ontario)

- May be called "Medical Health Officer" (MHO) in other provinces
- Appointed to each public health unit by the board of health
- Held by a licensed physician with public health training
- Responsibilities include:
 - Collection and analysis of epidemiological data
 - Occupational and environmental health surveillance
 - Implementation of health programs, including:
 - Counseling
 - Family planning services
 - Parenting programs, prenatal courses
 - Preschool and school health services
 - Disease screening programs
 - Tobacco use prevention programs
 - Nutrition services to schools and seniors' centres
- The Medical Officer of Health can require an individual/premise/agency to take or refrain from any action due to a public health hazard

Determinants of Health

Concepts of Health

- wellness:** state of dynamic physical, mental, social, and spiritual well-being that enables a person to achieve full potential and have an enjoyable life
- disease:** abnormal, medically-defined changes in the structure or function of the human body
- illness:** an individual's experience or subjective perception of a lack of physical or mental well-being and consequent inability to function normally in social roles
- illness behaviour:** an individual's actions in response to their illness, including whether they seek health care and whether they comply with the subsequent recommendations
- sickness:** socially and culturally held conceptions of health conditions that may influence how the patient reacts
- impairment:** any loss or abnormality of psychological, physiological, or anatomical structure or function
- disability:** any restriction or lack of ability to perform an activity within the range considered normal for a human being
- handicap:** the disadvantage for an individual arising due to impairment and disability
 - limits or prevents the fulfillment of an individual's normal role as determined by society and depends on age, sex, social, and cultural factors
 - changes the individual's relationship with the physical and social environment
- health equity:** when all people have "the opportunity to attain their full health potential" and no one is "disadvantaged from achieving this potential because of their social position or other socially determined circumstance." Differs from health equality. Health inequities are those which are considered unjust and/or avoidable
- health equality:** defined as where populations have equal or similar health status. Health inequalities are systematic differences in health status that occur among population groups

Determinants of Health

- 1974: the Honourable Marc Lalonde, federal Minister of Health, presented the health field concept entitled *A New Perspective on the Health of Canadians* which included four areas that interact to determine health: human biology, environment, lifestyle, and health care. This concept has been expanded to include numerous determinants of health

Definitions of Health

- First multidimensional definition of health, as defined by the WHO in 1948: "state of complete physical, mental and social well-being and not merely the absence of disease or infirmity"
- WHO updated the definition (socio-ecological definition) of health in 1986: "The ability to identify and to realize aspirations, to satisfy needs, and to change or cope with the environment. Health is therefore a resource for everyday life, not the objective of living. Health is a positive concept emphasizing social and personal resources, as well as physical capacities" (Ottawa Charter for Health Promotion)
- Other definitions of health have since been proposed that incorporate other dimensions of health (e.g. "Health is a social, economic, and political issue and above all a fundamental human right" – The People's Charter for Health)

Determinants of Health

- Income and social status
- Social support networks
- Education and literacy
- Employment and working conditions
- Social and work environments
- Physical environment
- Personal health practices and coping skills
- Healthy child development
- Biology, genetics, and epigenetics
- Health services
- Gender
- Culture

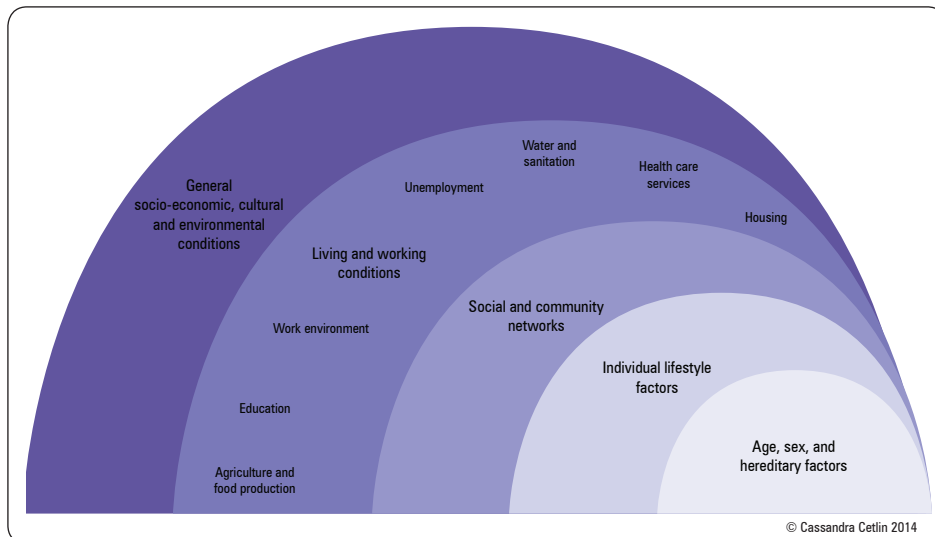

Figure 1. Population health model

Adapted from Dahlgren G, Whitehead M. European strategies for tackling social inequities in health: Leveling up Part 2. World Health Organization, 2006.

Vulnerable Populations

Table 2. Health Determinants of Vulnerable Populations

	Definition	Psychosocial/ Socioeconomic	Physical Environment	Individual Behaviour	Population-Specific Interventions
Aboriginal Peoples	Four specific groups: First Nations Status Indians (registered under the <i>Indian Act</i>), non-Status Indians, Métis, and Inuit	Low income Family violence Low education status Unemployment Homelessness Longer length of disability	Crowded housing Inefficient ventilation Environmental toxins (botulism) TB declining but prevalence higher than rest of population	Smoking Substance misuse Excessive gambling Poor nutrition Sedentary lifestyle High BMI Higher risk of suicide	Mental health awareness Aboriginal-specific DM initiatives Substance abuse treatment programs
Isolated Seniors	Individuals >65 yr	Elder abuse Lack of emotional support Isolation	Low hazard tolerance Institutionalization Mobility issues	Inactivity Polypharmacy Medical comorbidities	Aging in place of choice Falls and injury prevention Mental health promotion Preventing abuse and neglect
Children in Poverty	Based on Low Income Cut Offs (LICO) LICO is an income threshold below which a family will likely devote a larger share of its income on the necessities of food, shelter and clothing than the average family	Low income Family dysfunction Lack of educational opportunities	Housing availability Unsafe housing Lack of recreational space	Poor supervision Food insecurity High risk behaviours	Improvements in family income most significant Early childhood education
People with Disabilities	Includes impairments, activity limitations, and participation restrictions	Low income Low education status Discrimination Stigma	Institutionalization Barriers to access Transportation challenges	Substance misuse Poor nutrition Inactivity Dependency for ADLs	Transportation support Multidisciplinary care Unique support for individuals with specific disabilities (e.g. Trisomy 21)
New Immigrants	Person born outside of Canada who has been granted the right to live in Canada permanently by immigration authorities	Access to community services Cultural perspectives (including reliance on alternative health practices)	Exposure to diseases and conditions in country of origin (e.g. smoke from wood fires, incidence of TB, etc.)	Employment, ESL Healthy Newcomer Effect (health worsens over time to match that of the general population) Cultural or religious expectations	Women's health Mental health Infectious diseases (syphilis blood test, CXR, HIV) Dental and vision screening Vaccinations Cancer screening

Social Determinants: Indigenous People's Health in Canada

- **Colonization:** subjugation of Indigenous peoples by the Europeans, leading to the loss of lands, cultural practices, and self-government
- **Residential schools:** placement of children from Indigenous groups in church-run, government-funded schools for the purpose of assimilation, resulting in loss of identity, alienation, and abuse, with long-lasting consequences of higher rates of addictions, abusive relationships, and suicide
- **Treaties and Land Claims:** inadequate services for those living on reserves leading to poverty and poor quality infrastructure, reflected in disproportionate burden of infectious diseases (e.g. pertussis, Chlamydia, hepatitis, shigellosis)
- **Traditional Approach to Healing:** restoring balance in the four realms of spiritual, emotional, mental and physical health of a person acting as an individual, as well as a member of a family, community and nation
 - Ideas represented by medicine wheel of First Nations peoples, the Learning Blanket of Inuit peoples, and the Metis tree model of Holistic Lifelong Learning
 - Contrast to Western medicine focus of treating illness, leading to challenges for practitioners of Western medicine to meet Aboriginal patients' needs
 - National Aboriginal Health Organization (NAHO) offers 8 guidelines on practicing culturally safe health care for Aboriginal patients including need to allow Aboriginal patients access to ceremony, song, and prayer; the need for information and for family support; guidelines for the appropriate disposal of body parts and for handling death

New Immigrants to Canada

- **Mandatory medical exams** on entry to Canada by a designated medical practitioner:
 - Complete medical examination for all persons of all ages
 - Chest x-ray and report for persons 11 yr of age and over
 - Urinalysis for persons 5 yr of age and over
 - Syphilis serology for persons 15 yr of age and over
 - HIV testing for applicants 15 yr of age and over, as well as for those children who have received blood or blood products, have a known HIV-positive mother, or have an identified risk. An ELISA HIV screening test should be done for HIV 1 and HIV 2
 - Serum creatinine if the applicant has hypertension (resting blood pressure greater than 140/90 mmHg), a history of treated hypertension, DM, autoimmune disorder, persistent proteinuria, or kidney disorder
- Citizenship and Immigration Canada Handbook. <http://www.cic.gc.ca>

Table 2. Health Determinants of Vulnerable Populations (continued)

	Definition	Psychosocial/ Socioeconomic	Physical Environment	Individual Behaviour	Population-Specific Interventions
Homeless Persons	An individual who lacks permanent housing	Low income Food insecurity Mental illness	Exposure to temperature extremes Infections such as West Nile Virus	Substance misuse Violence	Safe housing Addictions support Mental health
Refugee Health	Forced to flee country of origin because of a well-founded fear of persecution and given protection by the Government of Canada <i>Refugee claimant:</i> Arrive in Canada and ask to be considered refugee	Post-traumatic stress disorders Depression Adjustment problems Partial health coverage via Interim Federal Health Program	Diseases and conditions in country of origin (e.g. malaria, TB, onchocerciasis, etc.) Direct and indirect effects of war	Employment ESL Longstanding prior lack of access to health care (chronically neglected problems) Cultural or religious expectations	Vaccinations Women's health Mental health Infectious diseases Dental and vision screening Political advocacy

Note: this chart delineates the major challenges faced by each group, but the issues listed are not unique to each population

Disease Prevention

Natural History of Disease

- course of a disease from onset to resolution
 - pathological onset
 - presymptomatic stage: from onset to first appearance of symptoms/signs
 - clinically manifest disease: may regress spontaneously, be subject to remissions and relapses, or progress to death

Disease Prevention Strategies

- measures aimed at preventing the occurrence, interrupting through early detection and treatment, or slowing the progression of disease/mitigating the sequelae

Table 3. Levels of Disease Prevention

Level of Prevention	Goal	Sample Strategies
Primary	Protect health and prevent disease onset	Immunization programs (e.g. measles, diphtheria, pertussis, tetanus, polio, see Pediatrics , P3) Smoking Cessation Seatbelt use
Secondary	Early detection of disease to minimize morbidity and mortality	Mammography Routine Pap smears
Tertiary	Treatment and rehabilitation of disease to prevent progression and permanent disability	DM monitoring with HbA1c, eye exams, foot exams Medication

Passive prevention, measures that operate without the person's active involvement (e.g. airbags in cars) are more effective than active prevention, measures that a person must do on their own (e.g. wearing a seatbelt)

Example of Primary Prevention
Gardasil Vaccine and Its Efficacy in the Prevention of Cervical Cancer
Gardasil® is a quadrivalent HPV vaccine covering strains 6,11,16,18. The efficacy of Gardasil® was studied in 4 randomized, double-blind, placebo controlled trials on females between 16 and 26 yr of age and was found to prevent nearly 100% of precancerous cervical changes for up to 4 yr after vaccination

Screening (Secondary Prevention)

- presumptive identification (not diagnosis) of unrecognized disease or defect by the application of tests, examinations, or other procedures which can be applied rapidly
- types of screening**
 - mass screening: screening all members of a population for a disease (e.g. phenylketonuria (PKU) and hypothyroidism in all newborns)
 - selective screening: screening of a specific subgroup of the population at risk for a disease (e.g. mammography in women >50 yr old)
 - multiphasic screening: the use of many measurements and investigations to look for many disease entities (e.g. periodic health exam)
- bias in screening**
 - lead-time:** time between early diagnosis with screening, and when diagnosis would have been made without screening
 - lead-time bias:** over-estimation of survival when the estimate is made from the time of screening, instead of the later time when the disease would have been diagnosed without screening
 - length-time bias:** overestimation of the survival time due to the sampling of prevalent as opposed to incident cases
 - selection of prevalent cases will favour the over-inclusion of longer-living cases rather than newly-diagnosed incident cases, some of whom may have short survival times

Figure 2. Lead-time bias

Table 4. Ideal Criteria for Screening Tests

Disease	Test	Health Care System
Causes significant suffering and/or death Natural history must be understood Must have an asymptomatic stage that can be detected by a test Early detection and intervention must result in improved outcomes Incidence is not too high or too low	High specificity and sensitivity Safe, rapid, easy, relatively inexpensive Acceptable to providers and to population	Adequate capacity for reporting, follow-up, and treatment of positive screens Cost effective Sustainable program Clear policy guidelines

Ottawa Charter for Health Promotion (1986)

- Health promotion: the process of enabling people to increase control over and improve their health
- The charter states that governments and health care providers should be involved in a health promotion process that includes:
 1. Building healthy public policy
 2. Creating supportive environments
 3. Strengthening community action
 4. Developing personal skills
 5. Re-orienting health services

Health Promotion Strategies

Table 5. Disease Prevention vs. Health Promotion Approach

Disease Prevention	Health Promotion
Health = absence of disease	Health = positive and multidimensional concept
Medical model (passive role)	Participatory model of health
Aimed mainly at high-risk groups in the population	Aimed at the population in its total environment
One-shot strategy, aimed at a specific pathology	Diverse and complementary strategies aimed at a network of issues/determinants
Directive and persuasive strategies enforced in target groups	Facilitating and enabling approaches by incentives offered to the population
Focused mostly on individuals and groups of subjects	Focused on a person's health status and environment
Led by professional groups from health disciplines	Led by non-professional organizations, civic groups, local, municipal, regional, and national governments

Source: Shah CP. Public Health and Preventive Medicine in Canada, 5th ed. Toronto: Elsevier, 2003

Healthy Public Policy

- characterized by an explicit concern for health and equity in all areas of policy and by an accountability for health impact
- main aim: to create a supportive environment to enable people to lead healthy lives, thereby making healthy choices easier for citizens
- government sectors must take into account health as an essential factor when formulating policy and should be accountable for the health consequences of their policy decisions
- methods
 - fiscal: imposing additional costs (e.g. taxes on tobacco and alcohol)
 - legislative: implementing legal deterrents (e.g. smoking bans, legal alcohol drinking age)
 - social: improving health beyond providing universally funded health care (e.g. providing affordable housing)

Source: International Conference on Health Promotion, Adelaide, South Australia (1998)

Behaviour Change

- health education serves to
 - increase knowledge and skills
 - encourage positive behaviour changes and discourage unhealthy choices
- health education is an important component of eliciting behaviour change
- behaviour is a result of three factors
 1. predisposing factors: knowledge, attitude, beliefs, values, intentions
 2. enabling factors: skills, supports
 3. reinforcing factors: health care professionals and the social context of family and community
- **Health Belief Model (1975)**
 - behaviours undertaken by individuals in order to remain healthy are a function of a set of interacting beliefs
 - beliefs include an individual's perception of his or her susceptibility to a disease, the severity of the disease, and the benefits and costs of health-related actions
 - beliefs are modified by socio-demographic and psychosocial variables

Example of Harm Reduction Strategy Summary of Findings from the Evaluation of a Pilot Medically Supervised Safer Injecting Facility

CMAJ 2006;175:1399-1404

Background: This study discusses the outcomes among a population of illicit injection drug users (IDUs) after initiating a supervised safe injecting facility in Vancouver, September 2003. Legal exemption by the Canadian government was granted such that an evaluation of its results be conducted over a 3 yr period.

Study Population: IDUs of the Vancouver area were allowed to inject previously obtained illicit drugs under the supervision of nurses and physicians. IDUs were offered addiction counseling and supports for appropriate community resources. A random sample of 670 IDUs was recruited and monitored from Dec 2003-July 2004.

Results: Characteristics of IDUs who used the safe injecting facility included age <30 yr, history of public drug use, homelessness, daily heroin and/or cocaine injection, and recent history of overdose. Mean measures of public order problems were taken 6 wk before and 12 wk after initiation of the safer injection facility. It was found that the mean number of IDUs injecting daily in public, along with the mean number of publically discarded syringes were reduced by approximately half.

Conclusions: Overall it has been found that the safer injecting facility in Vancouver has been successful in attracting IDUs at increased risk of HIV, overdose, and public injection of substances. This has resulted in lower incidences of public drug use, publicly discarded syringes and sharing of needles. Other studies associated with this one have demonstrated that there has been no increase in the drug dealing, drug related crimes, or rates of new IDUs in the area surrounding the safer injecting facility.

- individuals must believe that the action will have positive consequences
- individuals must be in a state of readiness
- behaviour can be stimulated by cues to action, which are specific events that can encourage preventive health decisions and actions (e.g. physician recommendation, public advertising)
- **Stages of Change Model**
 - provides a framework in which the Health Belief Model is applied to facilitating behaviour change (e.g. quitting smoking)

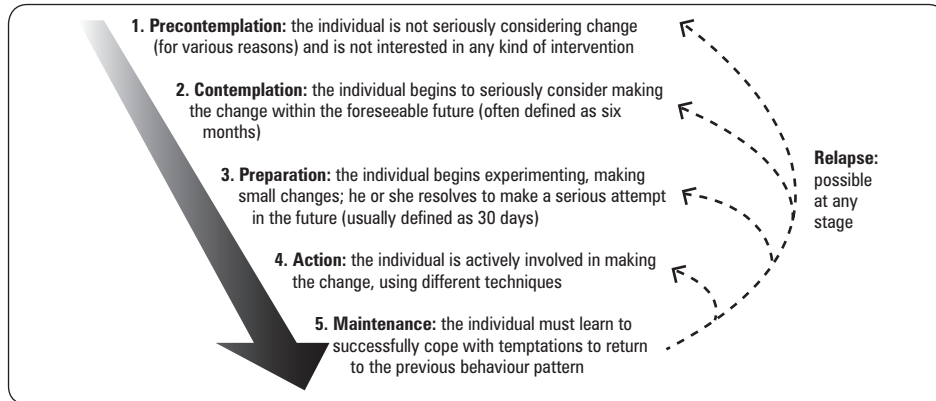

Figure 3. Stages of change model

Source: Prochaska JO, DiClemente CC, and Norcross JC. In Search of How People Change. Applications to Addictive Behaviours. Am Psychol 1992;47:1102-1114

Risk Reduction Strategies

- **risk reduction:** lower the risk to health without eliminating it (e.g. avoiding sun to lower risk of skin cancer)
- **harm reduction:** tolerance of some degree of risk behaviour, while aiming to minimize the adverse outcomes associated with these behaviours (e.g. needle exchange programs)

Incidence and Prevalence

Incidence = $\frac{\text{\# of new cases in a time interval}}{\text{total population at risk}}$
(measures the rate of new infections)

Prevalence = $\frac{\text{\# of existing cases at a point in time}}{\text{total population at risk}}$
(measures the frequency of disease at a point in time)

e.g. For Canada in 2011:
HIV incidence rate is 9.5 per 100,000 people
HIV prevalence is 213 per 100,000 people

Top 5 Causes of Mortality in Canada, 2012, by Sex

Female

- Cancer
- Heart disease
- Stroke
- COPD/chronic lower respiratory disease
- Alzheimer's

Male

- Cancer
- Heart disease
- Accidents
- Stroke
- COPD/chronic lower respiratory disease

Source: Statistics Canada. CANSIM, 2012. Table 102-0561 and 102-0562 and catalogue no.84-215-X

Principles of Standardization

- When comparing an outcome (e.g. mortality) in two populations that differ in terms of characteristics known to influence that outcome (e.g. age), standardization is used to control for the effect of that factor
- **Standardization is either direct or indirect**
 - **Indirect standardization** is expressed as standardized outcome ratio. For example, Standardized Mortality Ratio (SMR) is calculated using age specific rates for a reference population, as well as age structure and total cases for a sample/known population. (e.g. an SMR of 100 signifies that deaths are at the expected level, a SMR of 110 indicates a death rate 10% higher than expected)
 - **Direct standardization** is expressed as a rate. (i.e. using age specific rates in a known/sample population against a standard population)

Measurements of Health and Disease in a Population

MEASURES OF DISEASE RATES

Incidence Rate

- number of new cases in a population over a defined period of time

Prevalence

- **total number** of cases in a population over a defined period of time
- two forms of prevalence
 - **point prevalence:** attempts to measure the frequency of all disease at one specific point in time, therefore knowledge of the time of onset of disease is not required
 - **period prevalence:** measure constructed from prevalence at a point in time, plus new cases and recurrences over a defined period of time
- depends on **incidence rate** and disease duration from onset to termination (cure or death)
- favours the inclusion of chronic over acute cases and may be used to present a biased picture of the disease
- prevalence studies are cross-sectional and cannot be used for causal inferences
- prevalence figures are useful for determining the extent of a disease and can aid in the rational planning of facilities and services

Age Standardized Rate

- adjustment of the crude rate of a health-related event using a "standard" population
- standard population is one with a known number of persons in each age and sex group
- standardization prevents bias which could be made by comparing crude rates from two dissimilar populations (e.g. crude death rates over a number of decades are not comparable as the population age distribution has changed with time)

MEASURES OF MORTALITY

Life Expectancy

- the expected number of years that an individual will live based on standardized death rates for the population
- usually qualified by country, gender, and age

Crude Death Rate

- mortality rate from all causes of death per 1,000 in the population

Infant Mortality Rate (IMR)

- number of deaths among children under 1 yr of age reported during a given time period divided by the number of live births reported during the same time period and expressed per 1,000 live births per year

Maternal Mortality Rate (MMR)

- number of deaths of women during pregnancy and due to puerperal causes per 100,000 live births per year

Standardized Mortality Rate (SMR)

- the ratio of the observed (actual) number of deaths to the expected number of deaths for a group (e.g. age, race, gender, etc.)
- useful for comparing populations that are significantly different in some aspect (e.g. the causes of death in more and less developed countries)

MEASURES OF DISEASE BURDEN

Potential Years of Life Lost (PYLL)

- calculated for a population using the difference between the actual age at death and a standard/expected age at death
- increased weighting of mortality at a younger age

Disability Adjusted Life Year (DALY)

- quantitative indicator of the burden of diseases that reflects the total amount of disability-free life years lost
- includes loss from premature mortality and loss due to a degree of disability over a specific period of time; these disabilities can be physical or mental

Quality Adjusted Life Year (QALY)

- a value from 0 to 1 assigned to a year of life based on perceived quality of life; a yr in "perfect" health is considered equal to 1 QALY, the value of a year in ill health would be lowered based on the burden of disease
- it is possible to have "states worse than death" for example QALY <0 for extremely serious conditions

For additional rate calculations see *Outbreak of Infectious Diseases*, PH19

Consult the Public Health Agency of Canada for examples and latest statistics

<http://www.phac-aspc.gc.ca/cphorsphc-respcacsp/2008/fr-rc/cphorsphc-respcacsp06b-eng.php>

Epidemiology

Population

- a collection of individuals who share a common trait (most commonly applied to a geographic area but it could be another factor such as ethnic group)

Sample

- a selection of individuals from a population or set of observations
- types
 - random: all are equally likely to be selected
 - systematic: an algorithm is used to select a subset
 - stratified: separate representations of more than one subgroup
 - cluster: grouped in space/time to reduce costs
 - convenience: non-random inclusion, usually volunteers

Sample Size

- sample size contributes to the statistical precision of the observed estimate
- increasing the sample size decreases the probability of type I and type II errors (see *Data Analysis*, PH14)

Bias

- non-random error leading to a deviation of inferences or results from the truth
- any trend in the collection, analysis, interpretation, publication, or review of data that can lead to conclusions that are systematically different from the truth
 - **sampling bias:** occurs with the selection of a sample that does not truly represent the population
 - ♦ sampling procedures should be chosen to prevent or minimize bias
 - **measurement bias:** systematic error arising from inaccurate measurements of subjects
 - **recall bias:** when individuals with a disease are more prone to recalling or believing they were exposed to a possible causal factor than those who are free of disease

Confounder

- a variable that is related to both the exposure and outcome but is not measured or is not distributed equally between groups
- distorts the apparent effect of an exposure or risk because it may not be possible to separate/control for the contribution of a single causal factor to an effect (e.g. late maternal age could be a confounder in an investigation of birth order >4 and risk of developing Trisomy 21)

SPIN: use a **SP**ecific test to rule **IN** a hypothesis. Note that specific tests have very few false positives. If you get a positive test, it is likely a true positive

SNOUT: use a **SEN**sitive test to rule **OUT** a hypothesis. Note that sensitive tests have very few false negatives. If you get a negative test, it is likely a true negative

Interpreting Test Results

TP = True positive TN = True negative FP = False positive FN = False negative

		Disease	
		Present	Negative
Test Result	Positive	TP	FP
	Negative	FN	TN

Sensitivity = $TP / (TP + FN)$

Specificity = $TN / (TN + FP)$

Likelihood Ratio (LR)

- Likelihood that a given test result would be expected in a patient with disease compared with the likelihood that the same result would be expected in a patient without disease
- LR+ indicates how much the probability of disease increases if the test is positive
- LR- indicates how much the probability of disease decreases if the test is negative

$$LR+ = \frac{\text{Sensitivity}}{1 - \text{Specificity}} = \frac{TP / (TP + FN)}{FP / (TN + FP)}$$

$$LR- = \frac{1 - \text{Sensitivity}}{\text{Specificity}} = \frac{FN / (TP + FN)}{TN / (TN + FP)}$$

Positive Predictive Value (PPV)

- Proportion of people with a positive test who have the disease

$$PPV = \frac{TP}{TP + FP}$$

Negative Predictive Value (NPV)

- Proportion of people with a negative test who are free of disease

$$NPV = \frac{TN}{TN + FN}$$

		Advanced Neoplasia	
		Present	Negative
Test Result	Positive	68	147
	Negative	216	2234
Total		284	2381

Sensitivity = $68 / 284 = 23.9\%$

Specificity = $2234 / 2381 = 93.8\%$

$$LR+ = \frac{0.239}{1 - 0.938} = 3.85$$

$$LR- = \frac{1 - 0.239}{0.938} = 0.81$$

$$PPV = \frac{68}{68 + 147} = 31.6\%$$

$$NPV = \frac{2234}{2234 + 216} = 91.2\%$$

Figure 5. Interpreting test results: Practical example using FOBT testing in advanced colon cancer

Source: Numbers from Collins J, Lieberman D, Durbin T, et al. Accuracy of screening for fecal occult blood on a single stool sample obtained by digital rectal examination: a comparison with recommended sampling practice. *Ann Intern Med* 2005;142:81-85

Figure 4. Understanding sensitivity and specificity

Figure 4a. Hypothetical population

Figure 4b. Results of diagnostic test on hypothetical population

Figure 4c. Sensitivity of test (e.g. 24/30 = 80% sensitive)

Figure 4d. Specificity of test (e.g. 56/70 = 80% specific)

Source: Loong TW. Understanding sensitivity and specificity with the right side of the brain. *BMJ* 2003;327:716-719

Sensitivity

- proportion of people with disease who are correctly identified by having a positive test

Specificity

- proportion of people without disease who are correctly identified by having a negative test

Pre-Test Probability

- an estimate of the likelihood a particular patient has a given disease based on known factors

Post-Test Probability

- a revision of the probability of disease after a patient has been interviewed and examined
- calculation process can be more explicit using results from epidemiologic studies, knowledge of the accuracy of tests, and Bayes' theorem
- the post-test probability from clinical examination is the basis of consideration when ordering diagnostic tests or imaging studies
 - after each iteration the resultant post-test probability becomes the pre-test probability when considering new investigations

Effectiveness of Interventions

Effectiveness, Efficacy, Efficiency

- three measurements indicating the relative value (beneficial effects vs. harmful effects) of an intervention
 - efficacy:** the extent to which a specific intervention produces a beneficial result under ideal conditions
 - ideally, based on the results of a randomized control trial (the theoretical impact)
 - effectiveness:** measures the benefit of an intervention under usual conditions of clinical care
 - considers both the efficacy of an intervention and its actual impact on the real world, taking into account access to the intervention, whether it is offered to those who can benefit from it, its proper administration, acceptance of intervention, and degree of adherence to intervention
 - efficiency:** a measure of economy of an intervention with known effectiveness
 - considers the optimal use of resources (e.g. money, time, personnel, equipment, etc.)

Disease (e.g. lung CA)

Exposure (e.g. smoking)	Disease (e.g. lung CA)		
	Present	Absent	Total
Present	A	B	A + B
Absent	C	D	C + D
Total	A + C	B + D	A + B + C + D

Case-Control Study

$$\text{odds ratio (OR)}^* = \frac{A \times C}{B \times D} = \frac{A \times D}{B \times C}$$

Cohort Study

$$\frac{A}{A+B} = \text{incidence rate of health outcome in exposed} \quad \frac{C}{C+D} = \text{incidence rate of health outcome in non-exposed}$$

$$\text{relative risk (RR)}^{**} = \frac{A}{A+B} \div \frac{C}{C+D} \quad \text{attributable risk (AR)}^{***} = \frac{A}{A+B} - \frac{C}{C+D}$$

*Ratio of the odds in favour of the health outcome among the exposed to the odds in favour among the unexposed

**Ratio of the risk of a health outcome among exposed to the risk among the unexposed

***Rate of health outcome in exposed individuals that can be attributed to the exposure

Figure 7. Measures of effect by study type

Sensitivity and specificity are characteristics of the test

LR depends on the test characteristics, not the prevalence

PPV and NPV depend on the prevalence of the disease in the population

Figure 6. Fagan's likelihood ratio nomogram: Practical example using PSA levels to calculate post-test probability of prostate cancer

Source: Modified from Holmstrom B, Johansson M, Bergh A, et al. Prostate specific antigen for early detection of prostate cancer: longitudinal study. BMJ 2009;339:b3537

Equations to Assess Effectiveness

CER = control group event rate
EER = experimental group event rate
RR = EER/CER
AR = CER - EER
NNT = 1/ARR

Beware

Do not be swayed by a large RR, as it may appear to be large if event rate is small to begin with. In these cases AR is more important (e.g. a drug which lowers an event which occurs in 0.1% of a population to 0.05% can boast a RR of 50%, and yet the AR is only 0.05%, which is not nearly as impressive)

Number Needed to Treat (NNT)

- number of patients who need to be treated to achieve one additional favourable outcome
- only one of many factors that should be taken into account in clinical or health system decision making (e.g. must take into account cost, ease, feasibility of intervention)
 - a condition with death as a potential outcome can have a higher NNT (and be acceptable), as compared to an intervention to prevent an outcome with low morbidity, in which a low NNT would be necessary

NNT

Consult <http://www.thennt.com> for quick summaries of evidence-based medicine (includes NNT, LR, and risk assessments)

Number Needed to Harm (NNH)

- number of patients who, if they received the experimental treatment, would lead to one additional patient being harmed, compared with patients who received the control treatment

Adherence (formerly compliance)

- degree to which a patient follows a treatment plan

Coverage

- extent to which the services rendered cover the potential need for these services in a community

Types of Study Design

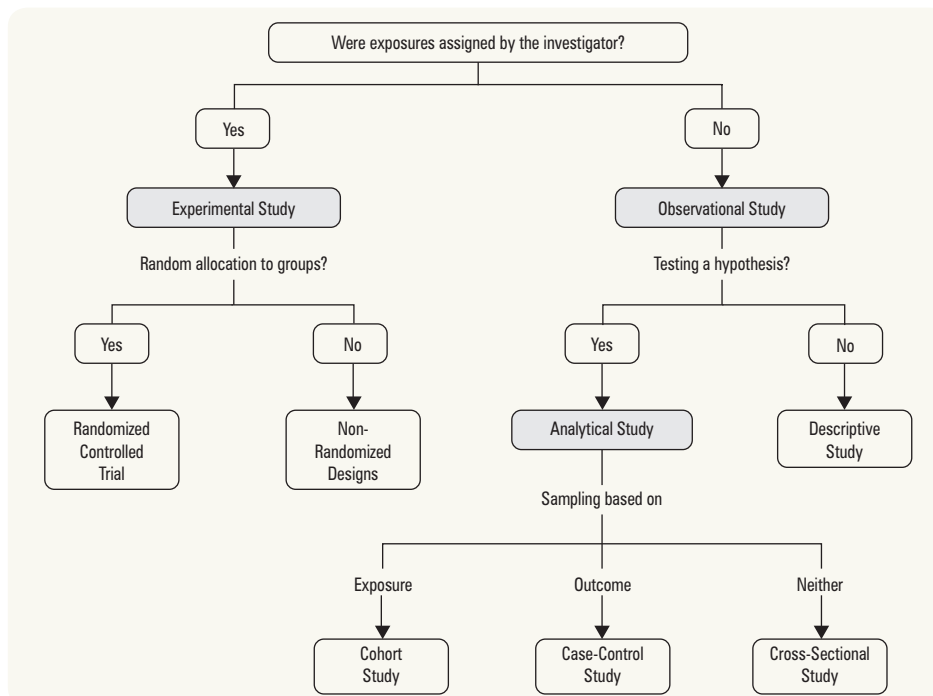

Qualitative vs. Quantitative

Table 6. Qualitative vs. Quantitative Study Designs

Qualitative	Quantitative
Generates hypothesis (Why? What does it mean?)	Tests hypothesis (What? How much/many?)
Inductive (specific to general): "bottom up" Observation → pattern → tentative hypothesis → theory	Deductive (general to specific): "top down" Theory → hypothesis → observation → confirmation
Sampling approach to obtain representative coverage of ideas or concepts	Sampling approach to obtain representative coverage of people in the population
Narrative: rich, contextual, and detailed information from a small number of participants	Numeric: frequency, severity, and associations from a large number of participants

Source: Adapted from <http://phprimer.afmc.ca>

Quantitative Research Methods

Formulating a Research Question

PICO

Patient Characteristics
Intervention of Interest
Comparison Group or Control Group
Outcome that you are trying to prevent or achieve

Figure 8. Quantitative study designs

Source: Adapted from <http://phprimer.afmc.ca>

Observational Study Designs

- observational studies involve neither the manipulation of the exposure of interest nor randomization of the study subjects
- there are two main subtypes of observational studies: descriptive and analytic studies

Descriptive Studies

- describe the events and rates of disease with respect to person, place and time and to estimate disease frequency and time trends
- first sets of studies and are used to generate an etiologic hypothesis, not test a hypothesis

Analytic Studies

- observational studies used to test a specific hypothesis
- includes ecological studies, cohort studies, case-control studies, and cross-sectional studies

An example of an ecological fallacy would be concluding that red wine drinking leads to lower risk of death from CVS disease after an ecological study shows that France has a higher rate of red wine consumption and a lower rate of death from CVS causes

Table 7. Observational Study Designs

Type of Study	Ecological	Cross-Sectional	Case-Control	Cohort
Definition	Units of analysis are populations or groups of people, rather than individuals	Assessment of individuals with respect to presence and absence of exposures and diseases at the same point in time	Samples a group of people who already have a particular outcome (cases) and compares them to a similar sample group without that outcome (controls)	Subjects are sampled and, as a group, classified on the basis of presence or absence of exposure to a particular risk factor
Subjects	Population (e.g. geographic areas)	Population (sample)	Two study sample populations are compared: cases and controls	One or more cohorts Cohort: group of people with common characteristics (e.g. year of birth) Divided into measured exposed vs. non-exposed groups
Methods	Descriptions of the average exposure or risk of disease for a population	Collect information from each person at one particular time Tabulate the numbers in groups (e.g. by presence or absence of disease/factor of interest) Make 2 x 2 table and compare groups Estimate prevalence	Ask cases and controls about exposures Select all the cases of a specific disease during a specific time frame Representative of spectrum of clinical disease Select control(s) Represent the general population To minimize risk of bias, may select more than one control group and/or match controls to cases (e.g. age, gender) Association can be concluded between the risk factor and the disease (odds ratio) Estimate incidence	Subjects are followed for a specific period of time to determine development of disease in each exposure group Prospective: measuring from the exposure to the future outcomes – looking forward Retrospective: measuring from outcomes to possible risk factors or protective factors – looking back Collect information on factors from all persons at the beginning of the study Tabulate the number of persons who develop the disease or other measured outcomes of morbidity Provides estimates of incidence, relative risk, attributable risk
Advantages	Quick, easy to do Uses readily available data Generates hypothesis	Determines association between variables Quick and uses limited resources Surveys with validated questions allows comparison between studies	Used when disease in population is rare (less than 10% of population) due to increased efficiency Less costly and time consuming	Shows an association between a factor and an outcome/several outcomes Stronger evidence for causation
Disadvantages	Poor generalizability to individual level (not direct assessment of causal relationship) Ecological fallacy: an incorrect inference about individuals in the population	Does not allow for assessment of temporal relationship or causation between variables Recall bias (see Bias , PH9)	Recall bias (see Bias , PH9) Confounding Selection bias for controls Only one outcome can be measured	By itself, cannot establish causation Confounding factors are common as the cohort self-selects the exposure, or unknown/unmeasured factors are associated with the measured exposure Cost and duration of time needed to follow cohort
Examples	A study looking at the association between smoking rates and lung cancer rates in different countries at the population level without individual data on both factors	A study that examines the distribution of BMI by age in Ontario at a particular point in time	A famous case control study is by Sir Richard Doll who demonstrated the link between tobacco smoking exposure and lung cancer cases at the individual level	A famous cohort study is the Framingham Heart Study, which assessed the long-term cardiovascular risks of diet, exercise, medications such as ASA, etc.

Experimental Study Designs

- not discussed here are non-randomized control trials (e.g. allocation by clinic or other non-random basis – performed when randomization is not possible) and clinical trials (e.g. test treatments or laboratory tests in human subjects)

RANDOMIZED CONTROLLED TRIAL (RCT)

Definition

- subjects are assigned by random allocation to two or more groups, one of which is the control group, the other group(s) receive(s) an experimental intervention

Subjects

- individuals are separated into groups by a random process to ensure as much as possible equal distribution of known and unknown factors except for the experimental exposure (e.g. the treatment)

Methods

- random allocation of individuals into two or more treatment groups through a centralized concealed process
- method of assessment to reduce bias
 - single-blind:** subject does not know group assignment (intervention or placebo)
 - double-blind:** subject and observer both unaware of group assignment
 - triple-blind:** subject, observer, and analyst unaware of group assignment (rarely done)
- one group receives placebo or standard therapy
- one or more groups receive(s) the intervention(s) under study
- the outcome is measured and the groups are compared
- all other conditions are kept the same between groups

Advantages

- “gold standard” of studies, upon which the practice of EBM is founded
- provides the strongest evidence for effectiveness of intervention
- with sufficient sample size and appropriate randomization, threats to validity are minimized
- allows prospective assessment of the effects of intervention while minimizing bias

Disadvantages

- some exposures are not amenable to randomization (e.g. cannot randomize subjects to poverty/wealth or to harmful exposures such as smoking) due to ethical or feasibility concerns
- difficult to randomly allocate groups (e.g. communities, neighbourhoods)
- difficult to study rare events, since RCTs would require extremely large sample sizes
- costly

Summary Study Designs

META-ANALYSIS

Definition

- a form of statistical analysis that combines the results of independent studies addressing a common research hypothesis, as identified through systematic review, into one large study

Subjects

- combination of all the subjects used in original studies

Methods

- selection of relevant studies from the published literature which meet quality criteria
- statistical models used to combine the results of each independent study
- provides a summary statistic of overall results as well as graphic representation of included studies

Advantages

- attempts to overcome the problem of reduced power due to small sample sizes of individual studies
- ability to control for inter-study variation

Disadvantages

- sources of bias may not be controlled for
- reliance on published studies may increase the potential conclusion of an effect as it can be difficult to publish studies that show no significant results (publication bias)
- the decision to include/reject a particular study is subjective

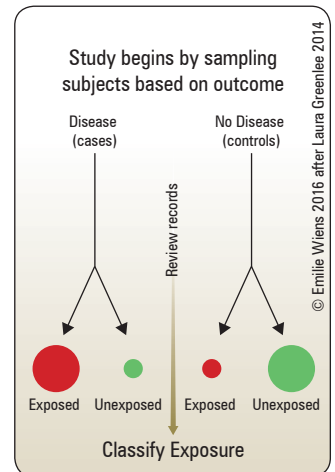

Figure 9. Case-control study

Adapted from <http://phprimer.afmc.ca>

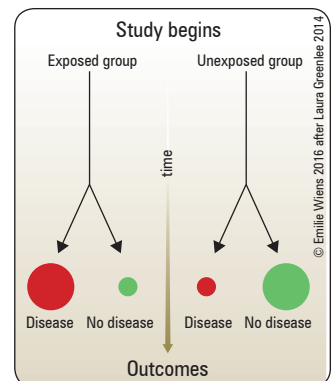

Figure 10. Cohort study

Adapted from <http://phprimer.afmc.ca>

Analysis

Per-Protocol Analysis (PP)

Strategy of analysis in which only patients who complete the entire study are counted towards the results

Intention-to-Treat Analysis (ITT)

When groups are analyzed exactly as they existed upon randomization (i.e. using data from all patients, including those who did not complete the study)

An example of an RCT is the SPARCL trial, which demonstrated intense lipid-lowering with atorvastatin reduces the risk of cerebro- and cardiovascular events in patients with and without carotid stenosis when compared to placebo

An example of a meta-analysis is one that compares the effects of ACE inhibitors, CCBs, and other antihypertensive agents on mortality and major cardiovascular events by compiling and analyzing data from a full set of reported RCTs

Consult the Cochrane Library of Systematic Reviews (<http://www.cochranelibrary.com>) for high-quality systematic reviews and meta-analyses

Methods of Analysis

Distributions

- distribution describes the probability of events
- normal (Gaussian) or non-normal (skewed, bimodal, etc.)
- characteristics of the normal distribution
 - mean = median = mode
 - 67% of observations fall within one standard deviation of the mean
 - 95% of observations fall within two standard deviations of the mean
- measures of central tendency
 - **mean:** sum of all observations divided by total number of variables
 - **median:** value at the 50th percentile, this is a better reflection of the central tendency for a skewed distribution
 - **mode:** most frequently observed value in a series
- measures of dispersion
 - **range:** the largest value minus the smallest value
 - **variance:** a measure of the spread of data
 - **standard deviation:** the average distance of data points from the mean (the positive square root of variance)
- given the mean and standard deviation of a normal or binomial distribution curve, a description of the entire distribution of data is obtained

Example Calculation

Data set: 17, 14, 17, 10, 7

Mean = $(17 + 14 + 17 + 10 + 7) \div 5 = 13$

Median (write the list in order, median is the number in the middle)
= 7, 10, 14, 17, 17 = 14

Mode (number repeated more often)
= 17

Range = $17 - 7 = 10$

Variance = $[(17 - 13)^2 + (14 - 13)^2 + (17 - 13)^2 + (10 - 13)^2 + (7 - 13)^2] \div 5 = 15.6$

Standard Deviation = 3.95

$\sqrt{\text{variance}} = \sqrt{15.6} = 3.95$

Data Analysis

Statistical Hypotheses

- **null (H_0)**
 - no relationship exists between the two stated variables (i.e. no association between the hypothesized exposure and the outcome)
- **alternative (H_1)**
 - a relationship does exist between the two stated variables

Type I Error (α Error)

- the null hypothesis is falsely rejected (i.e. concluding an intervention X is effective when it is not, or declaring an observed difference to be real rather than by chance)
- the probability of this error is denoted by the p-value
- studies tend to be designed to minimize this type of error, since a type I error can have larger clinical significance than a type II error

Type II Error (β Error)

- the null hypothesis is falsely accepted (i.e. stating intervention X is not effective when it is, or declaring an observed difference/effect to have occurred by chance when it is present)
- higher level of error is acceptable for most studies
- can also be used to calculate statistical power

Power

- probability of correctly rejecting a null hypothesis when it is in fact false (i.e. the probability of finding a specified difference to be statistically significant at a given p-value)
- power increases with an increase in sample size
- power = $1 - \beta$, and is therefore equal to the probability of a true positive result

Statistical Significance

- the probability that the statistical association found between the variables is due to random chance alone (i.e. that there is no association)
- the preset probability is set sufficiently low that one would act on the result; frequently $p=0.05$
- when statistical tests result in a probability less than the preset limit, the results are said to be statistically significant (i.e. $p<0.05$)

Clinical Significance

- measure of clinical usefulness (e.g. 1 mmHg BP reduction may be statistically significant, but may not be clinically significant)
- depends on factors such as cost, availability, patient compliance, and side effects in addition to statistical significance

Trend

- an observed directional relationship that does not meet criteria for statistical significance and thus should be interpreted with caution

Figure 11. Distribution curves

Type I (α) Error

"There Is An Effect" where in reality there is none

Confidence Interval (CI)

- provides a range of values within which the true population result (e.g. the mean) lies
- frequently reported as 95% CI (i.e. one can be 95% certain that the true value is within this data range)
- bounded by the upper and lower confidence limits

A wider confidence interval implies more variance than a tighter confidence interval

Data

- information collected from a sample of a population
- there are 2 overall classes of data listed with examples
 - **discrete**
 - ♦ categorical (e.g. gender, marital status)
 - ♦ ordinal (e.g. low, medium, high)
 - **continuous** (e.g. serum cholesterol, hemoglobin, age)

Accuracy

- how closely a measurement approaches the true value

Reliability

- how consistent a measurement is when performed by different observers under the same conditions or by the same observer under different conditions

Validity

- extent to which a measurement approaches what it is designed to measure
- determined by the accuracy and reliability of a test

Internal Validity

- degree to which the findings of the sample truly represent the findings in the study population
- dependent on the precision and accuracy

External Validity (i.e. Generalizability)

- degree to which the results of the study can be generalized to other situations or populations

Figure 12. Accuracy vs. reliability

Common Statistical Tests

Table 8. Statistical Tests

	Z-Test (known as t-test for samples <30)	Analysis of Variance (ANOVA)	Chi-Squared Test (χ^2)	Linear Regression	Logistic Regression
What are you trying to show?	Compare the mean values of an outcome variable between two groups (e.g. difference in average BP between men and women)	Compare the mean values of an outcome variable between two or more groups (e.g. difference in average BP between persons in three towns)	Test the correspondence between a theoretical frequency distribution and an observed frequency distribution (e.g. if one sample of 20 patients is 30% hypertensive and another comparison group of 25 patients is 60% hypertensive, a chi-squared test determines if this variation is more than expected due to chance alone)	Looks at associations between two or more continuous variables (e.g. age and blood pressure)	Shows how a change in one explanatory variable affects the status (e.g. ill vs. non-ill) of the outcome variable
What kind of data do you have in your study?	Data on two groups	Mean of groups (one or more) Overall mean of an entire sample	Data on two or more populations and two or more outcome measures	Data on at least one population	Data on at least one population
What kind of variables do you measure?					
Dependent Variable	Continuous data	Continuous data	Categorical (2 or more)	Continuous	Categorical (discrete outcomes usually dichotomous)
Independent Variable	Categorical (2 only)	Categorical (2 or more)	Categorical (2 or more)	Continuous	Continuous/categorical
Assumptions		"Normal" distribution	None	Dependent variable has "normal" distribution Linear relationship between variables	None

Causation

Criteria for Causation (Sir Bradford Hill)

1. **strength of association:** the frequency with which the factor is found in the disease and the frequency with which it occurs in the absence of disease
2. **consistency:** is it the same outcome with different populations or study design?
3. **specificity:** is the association particular to your intervention and measured outcome?
4. **temporal relationship:** did the exposure occur before the onset of the disease?
5. **biological gradient:** finding a quantitative relationship between the factor and the frequency (e.g. dose response relationship)
6. **biological plausibility:** does the association/causation make biological sense?
7. **coherence:** can the relationship be explained/accounted for based on what we know about the laws of science, logic, etc.?
8. **experimental evidence:** experiment that investigates what happens when the suspected offending agent is removed (e.g. is there improvement?)
9. **analogy:** do other established associations provide a model for this type of the relationship?

Note: Not all criteria must be fulfilled to establish scientific causation, and the modern practice of EBM emphasizes 'experimental evidence' as superior to other criteria for experimental causation review. However many causation questions in health cannot be answered with experimental methods.

Beware

Correlation ≠ Causation

e.g. There is evidence of a direct correlation between the amount of ice cream sold and the amount of deaths in swimming pools. Of course, ice cream does not cause drowning, rather, they both increase in the summer

Criteria for Causation

ACCESS PTB

Analogy
Consistency
Coherence
Experimental evidence
Strength of association

Plausibility
Temporal relationship
Biological gradient

Assessing Evidence

- critical appraisal is the process of systematically examining research evidence to assess validity, results, and relevance before using it to inform a decision

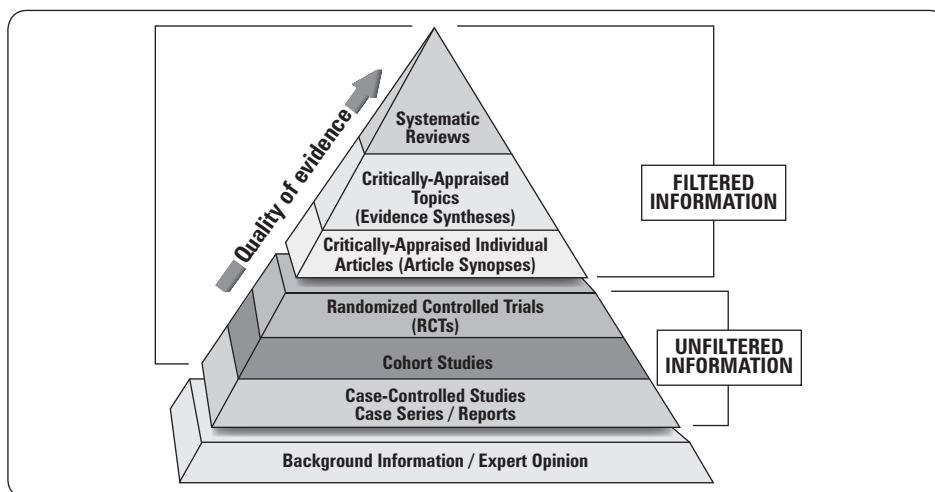

Figure 13. Pyramid of pre-appraised evidence

© Copyright 2006. Trustees of Dartmouth College & Yale University. All rights reserved. Produced by Glover J., Izzo D., Odato K. and Wang L.

A. Are the results of the study valid?

- see below for classifications of evidence that has already been assessed; see sidebar for assessing primary studies

B. What are the results?

- what was the impact of the treatment effect?
- how precise was the estimate of treatment effect?
- what were the confidence intervals and power of the study?

C. Will the results help me in caring for my patients?

- are the results clinically significant?
- can I apply the results to my patient population?
- were all clinically important outcomes considered?
- are the likely treatment benefits worth the potential harm and costs?

Validity

- The degree to which the outcome observed in the study can be attributed to the intervention

5 Questions About the Validity of Primary Studies

- Were the patients randomized?
- Was the follow-up of patients sufficiently long and complete?
- Were all patients analyzed in the groups to which they were randomized?
- Were the groups treated equally except for the intervention?
- Were the patients and clinicians kept blind to treatment?

Other Questions to Consider

- Were the groups similar (i.e. demographics, prognostic factors) at the start of the trial?
- Were the appropriate and valid exposure and outcome measures obtained?
- Were outcome assessors aware of group allocation?
- Was contamination reported?
- Were ethical issues continuously upheld?

Levels of Evidence: Classifications Cited in Guidelines/Consensus Statements

Level I evidence: based on RCTs (or meta-analysis of RCTs) big enough to have low risk of incorporating FP or FN results

Level II evidence: based on RCTs too small to provide Level I evidence; may show positive trends that are non-significant, or have a high risk of FN results

Level III evidence: based on non-randomized, controlled or cohort studies; case series; case-controlled; or cross-sectional studies

Level IV evidence: based on opinion of respected authorities or expert committees, as published consensus conferences/guidelines

Level V evidence: opinions of the individuals who have written/reviewed the guidelines (i.e. Level IV evidence), based on experience/knowledge of literature/peer discussion

Notes: These 5 levels of evidence are not direct evaluations of evidence quality or credibility; they reflect the nature of the evidence. While RCTs tend to be most credible (with <III), level III evidence gains credibility when multiple studies from different locations and/or time periods report consistent findings. Level IV and V evidence reflects decision-making that is necessary but in the absence of published evidence.

Figure 14. Levels of evidence classifications

Note: This is only one method of classifying evidence. Various systems exist, but operate within the same premise that certain types of evidence carry more weight than others

Health Services Research

Continuous Quality Improvement

Quality Improvement (QI)

- method of evaluating and improving processes; focusing more on systems and systematic biases, which are thought to be the cause of variation in quality, as opposed to individuals
- taking measures to increase efficiency of action with the purpose of achieving optimal quality

Quality Assurance

- management system to assure the quality of health care provided by workers and received by patients
- constantly aims to improve standards and the frequency of attaining those standards
- **five-stage process of quality assurance**
 1. establishment of functional goals
 2. implementation of procedures to achieve those goals
 3. regular assessment of performance relative to the goals
 4. proposal of solutions to close the gap between performance and goals
 5. documentation and reporting of this assessment activity

Quality Control

- method of maintaining standards by reviewing the quality of all factors involved in the process

Continuous Quality Improvement

- management approach to improve and maintain quality via continuous assessment of potential defects, followed by action to improve process, avoid decrease in quality or correcting process in early stages
- continuous feed-forward process

Quality Management

- encompasses quality assurance, quality control, and quality improvement to achieve consistent quality

Total Quality Management

- management philosophy for improving quality while controlling costs
- focusing on the system rather than the individual, to ensure decisions are made to support quality and remove barriers to quality inherent in bureaucratic, hierarchical systems

Audit

- process of systematic examination of a quality system carried out by internal or external quality auditors
- to determine whether quality processes and results comply with goals, and whether processes have been implemented effectively

Systems Analyses Tools

1. **5 Whys:** brainstorming to simplify the process of change; continue asking 'why' until the root of the problem is discovered
2. **Ishikawa Diagrams (i.e. Fishbone Diagrams):** identify generic categories of problems that have an overall contribution on the effect

Canadian Task Force on Preventive Health Care Grading of Health Promotion Actions

- A:** Good evidence to recommend the preventive health measure
- B:** Fair evidence to recommend the preventive health measure
- C:** Existing evidence is conflicting and does not allow making a recommendation for or against use of the clinical preventive action, however other factors may influence decision-making
- D:** Fair evidence to recommend against the preventive health measure
- E:** Good evidence to recommend against the preventive health measure
- I:** Insufficient evidence (in quantity and/or quality) to make a recommendation, however other factors may influence decision-making

Source: Canadian Task Force on Representative Health Care. Canadian task force on preventive new grades for recommendations
CMAJ 2003;169:207-208

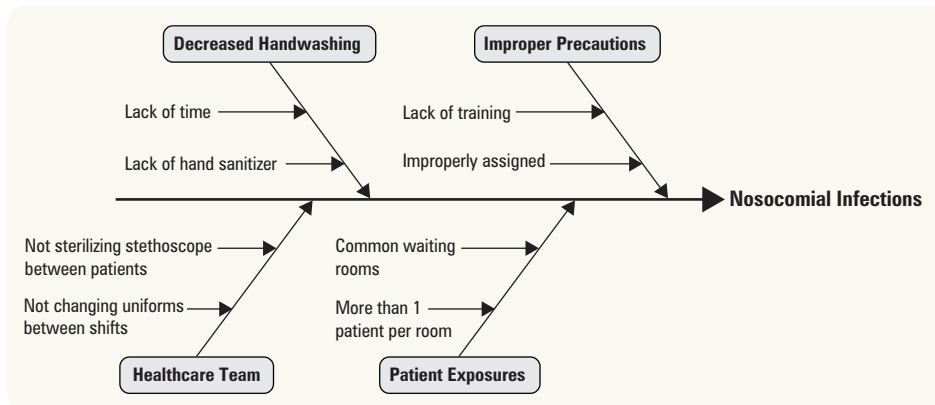

Figure 15. Ishikawa diagram

3. **Defect check sheets:** consider all defects and tally up the number of times the defect occurs
4. **Pareto Chart:** x vs. y chart; x-axis = defect categories, y-axis = frequency; plot cumulative frequency on the right y-axis
 - purpose is to highlight most important among large set of factors contributing to defects/poor quality

Precede-Proceed Model

- tool for designing, implementing, and evaluating health interventions/programs

Table 9. Precede-Proceed Model

PRECEDE Phase	PROCEED Phase
Phase 1 – Identify the ultimate desired result	Phase 5 – Implementation (design and conduct the intervention)
Phase 2 – Identify and set priorities among health issues and their behavioural and environmental determinants	Phase 6 – Process Evaluation (determine if the program is implemented as planned)
Phase 3 – Identify the predisposing, enabling, and reinforcing factors that affect the behaviours and environmental determinants	Phase 7 – Impact Evaluation (measure intermediate objectives – predisposing, enabling, and reinforcing factors)
Phase 4 – Identify the administrative and policy factors that influence what can be implemented	Phase 8 – Outcome Evaluation (measure desired result)

Cost Analysis

Cost Benefit Analysis (CBA)

- a process of, either explicitly or implicitly, weighing the total expected costs against the total expected benefits of one or more actions in order to choose the best or most profitable option
- all costs are adjusted for the time value of money so that costs that may change over time are expressed on a common basis in terms of their present value

Cost Effectiveness Analysis (CEA)

- a comparison of the relative expenditure (costs) and outcomes (effects) of two or more courses of action
- cost effectiveness analysis is often used where a full cost benefit analysis is inappropriate
- a CEA is commonly expressed in terms of a ratio: the denominator is a gain in health from a measure (e.g. years of life, premature births averted, sight-years gained) and the numerator is the cost of the health gain
- the most commonly used outcome measure is quality-adjusted life years (QALY) (see *Quality Adjusted Life Year*, PH8)

Outbreak of Infectious Diseases

Definitions

Endemic

- constant presence of disease or infectious agent in a given geographic area or population subgroup (i.e. usual rate of disease)

Outbreak

- occurrence of new cases clearly in excess of the baseline frequency of the disease in a defined community or population over a given period of time
- synonymous with epidemic, although generally considered to be an epidemic that is localized, has an acute onset, or is relatively short in duration

Epidemic

- any disease, infectious or chronic, occurring at a greater frequency than usually expected in a defined community or institutional population over a given time period (i.e. excessive rate of disease)

Pandemic

- epidemic over a wide area, crossing international boundaries, and affecting a large number of people

Attack Rate

- cumulative incidence of infection within a defined group observed during a specific period of time in an epidemic
- calculated by dividing the total number of people who develop clinical disease by the population at risk, usually expressed as a percentage

Secondary Attack Rate

- number of cases among contacts occurring within the incubation period following exposure to the primary case, in relation to the total exposed contacts
- infectiousness reflects the ease of disease transmission and is usually measured by the secondary attack rate

Virulence

- severity of the disease produced by the organism in a given host
- expressed as the ratio of the number of cases of severe and fatal infection to the total number of clinically affected

Case-Fatality Rate (CFR)

- proportion of individuals contracting a disease who die as a result of that disease
- most frequently applied to a specific outbreak of acute disease in which all patients have been followed for an adequate period of time to include all attributable deaths
- must be clearly differentiated from the mortality rate

Mortality Rate/Crude Death Rate

- estimation of the portion of the population that dies during a specified period from all causes of death

Infection Control Precautions

(see [Infectious Diseases](#), ID6)

Contact (impetigo, chicken pox, warts)

- Wash hands
- Gloves
- Gown
- Wipe equipment after use

Airborne (TB)

- Contact precautions PLUS
- N95 mask (fit tested)
- Negative pressure room

Droplet (influenza, mumps, pneumonia)

- Contact precautions PLUS
- Goggles/face shield
- Surgical mask

Source: Public Health Ontario. http://www.publichealthontario.ca/en/eRepository/IPAC_Clinical_Office_Practice_2013.pdf
<http://www.oahpp.ca/resources/documents/pidac/Routine%20Practices%20and%20Additional%20Precautions.pdf>

Steps to Control an Outbreak

1. Define the Problem

- is it an outbreak?

2. Appraise Existing Data and Institute a Surveillance System

- case definition:** formulated from the most common symptoms or signs; definition includes the likely date of onset of illness of the first case (e.g. any person with onset of fever higher than 38.5°C and cough within past 28 d)
- active surveillance:** identify those who may have been exposed to the infectious agent and who fit the case definition through active efforts, including
 - contacting emergency rooms, physicians' offices, local schools
 - obtaining records from health units, such as mortality or laboratory records

Active Surveillance

Outreach such as visits or phone calls by the public health/surveillance authority to detect unreported cases (e.g. an infection control nurse goes to the ward and reviews temperature charts to see if any patient has a nosocomial infection)

Passive Surveillance

A surveillance system where the public health/surveillance authority depends on others to submit standardized forms or other means of reporting cases (e.g. ward staff notify infection control when new cases of nosocomial infections are discovered)

3. Formulate Hypotheses and Implement Initial Control Measures

- track outbreak evolution to develop hypotheses about potential source and populations at risk
- case management depends on symptoms, suspected agent, population at risk, and location
- population management requires public health services in the community and infection control teams in hospitals to initiate initial control measures:
 - disseminate information about risk reduction
 - ensure adherence to personal preventative measures (e.g. hand hygiene, personal protective equipment)
 - prevent new cases (e.g. vaccination, post-exposure prophylaxis)
 - decrease risk of propagation (e.g. quarantine)
 - treat existing cases (e.g. antibiotics, antivirals, supportive care)

4. Test the Hypothesis through Analysis of Surveillance Data or Special Studies

- analyze outbreak surveillance data
- generate epidemic curves
 - usually a frequency histogram, with the number of cases plotted on the vertical axis and dates or times of onset along the horizontal axis
 - curve can indicate whether the epidemic (outbreak) has a common source or whether it is propagated
 - **point source epidemic:** exposure is brief and essentially simultaneous
 - **extended source epidemic:** exposure lasts for a period of days to weeks and may be continuous (no irregular peaks) or intermittent (irregularly spaced peaks)
 - **propagated epidemic:** begins with only a few exposed persons but is maintained by person-to-person transmission (e.g. measles/influenza); epidemic curve shows a series of peaks
- use epidemic curves, cross-sectional studies, and/or case-control studies to evaluate hypotheses about cause of outbreak

5. Draw Conclusions and Re-Adjust Hypothesis and Control Measures

- establish cause of outbreak with further epidemiologic investigation and revise initial control measures accordingly

6. Plan for Long-Term Prevention and Control

- implement prevention measures to avoid similar future incidents
 - strengthen resistance of hosts (e.g. immunization)
 - interrupt modes of transmission in environment (e.g. improvements in food processing)
- communicate outbreak prevention and control strategies to the public

For specific examples, see "Communicable Diseases" section in: Shah CP. Public Health and Preventive Medicine in Canada Toronto: Elsevier, 5th edition, 2003

Figure 16. Epidemic curves

Figure 16a. Point source epidemic curve

Figure 16b. Extended continuous source epidemic curve

Figure 16c. Propagated source epidemic curve

Infection Control Targets

- interventions should target host, agent, environment, and their interactions

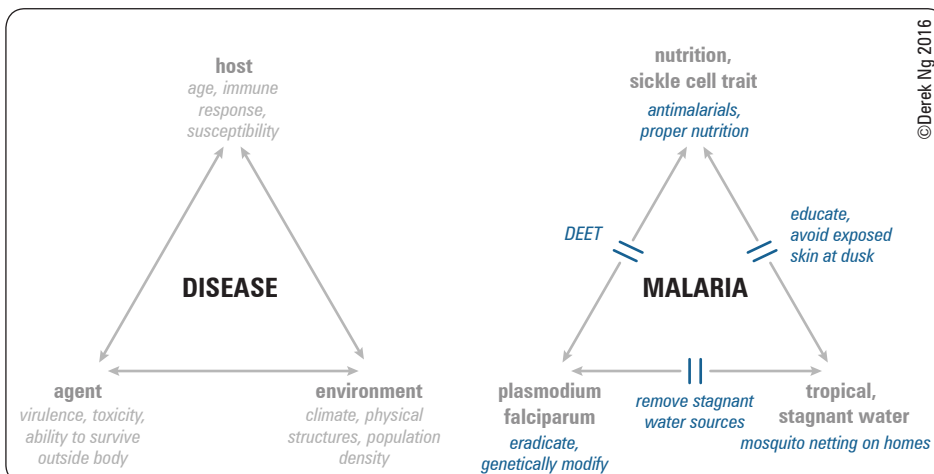

Figure 17. Epidemiology triad as framework for infection control interventions: Practical example using malaria

Environmental Health

Definition

- study of conditions in the natural and human-made environment that influence human health and well-being
- environmental exposures
 - four common hazards: chemical, biological, physical, and radiation
 - four main reservoirs: air, food, water, and soil
 - three main routes: inhalation, ingestion, or absorption (skin)
 - usually divided into two main settings
 - ♦ workplace (including schools): may see high level exposure in healthy individuals (see *Occupational Health*, PH23)
 - ♦ non-workplace: generally low level but chronic exposure; population at risk includes extremes of age, developing fetuses, and ill or immunocompromised individuals
- health impacts of the environment also include factors such as urban planning and how individuals interact with the built environment (e.g. safe pedestrian and bicycle paths are neighbourhood features that can facilitate more active lifestyles among residents)

Environmental Health Jurisdiction

Table 10. Environmental Health Jurisdiction

Public Health Unit	Enforcement of water and food safety regulations (including restaurant food safety) Sanitation Assessment of local environmental risks Monitoring and follow-up of reportable diseases
Municipal Government	Waste disposal Recycling Water and sewage treatment/collection/distribution
Provincial and Territorial Government	Water and air quality standards Industrial emission regulation Toxic waste disposal
Federal Government	Designating and regulating toxic substances Regulating food products (e.g. Health Canada) Setting policy for pollutants that can travel across provincial boundaries
International	Multilateral agreements (e.g. Kyoto Protocol, UN Convention on Climate Change, International Joint Commission)

Taking an Environmental Health History

CH₂OPD₂
Community
Home
Hobbies
Occupation
Personal habits
Diet
Drugs

Risk Assessment

Hazard Identification

- what is the hazard involved?
- assess potential hazards by taking an environmental health history

Risk Characterization

- is the identified agent likely to elicit the patient's current symptoms?
- review known health impacts of the hazard and identify specific properties that contribute to or diminish adverse effects (e.g. evaluate threshold levels)

Exposure Assessment

- is the patient's exposure to the environmental agent sufficient to have caused the current symptoms?
- quantify exposure through direct measurement or by reviewing frequency and nature of contact with hazard

BPA, the Toxin Concern of 2009

Bisphenol A (BPA) is a chemical compound found in some hard, clear, lightweight plastics and resins. According to the NIH, animal studies suggest that ingested BPA may imitate estrogen and other hormones. In October 2008, Canada became the first country in the world to ban the import and sale of polycarbonate baby bottles containing BPA, stating that although exposure levels are below levels that cause negative effects, current safety margins need to be higher. The US FDA does not consider normal exposure to BPA to be a hazard, however the NIH has some concern that fetuses, infants, and children exposed to BPA may be at increased risk for early-onset puberty, prostate, and breast cancer.

Air

Biological Hazards

- moulds thrive in moist areas; 10-15% of the population allergic
- bacteria survive as spores and aerosols, can be distributed through ventilation systems (e.g. *Legionella*)
- dust mites (year-round) and pollens (seasonal) can trigger upper and lower-airway symptoms

Chemical Hazards

- ground-level ozone
 - main component of smog with levels increasing in major cities
 - worsens asthma, irritates upper airway
- carbon monoxide (fossil fuel-related, common byproduct of combustion)
 - aggravates cardiac disease at low levels
 - headache, nausea, dizziness at moderate levels
 - fatal at high levels
- sulphur dioxide (fossil fuel-related), nitrogen oxides
 - contribute to acid rain and exacerbate breathing difficulties
- organic compounds at high levels (e.g. benzene, methylene chloride, tetrachloroethylene)
 - tend to be fat-soluble, easily absorbed through skin and difficult to excrete
- heavy metals emissions (e.g. nickel, cadmium, chromium)
 - variety of health effects: upper airway disease, asthma, decreased lung function
- second-hand tobacco smoke
 - respiratory problems, increase risk of lung cancer
 - particulates associated with decreased lung function, asthma, upper airway irritation

Radiation Hazards

- sound waves
 - ionizing radiation
 - radon is naturally produced by soil containing uranium or radium, can contaminate indoor air and is associated with a small proportion of lung cancers
- ultraviolet radiation is increasing due to ozone layer destruction and increases risk of skin cancer
 - non-ionizing radiation
 - visible light, infrared, microwave

Effects of Ionizing Radiation

α -particles are larger and damage the skin and bronchial lining (airway irritation)

β -particles are smaller and cause deeper damage (alveoli)

To Fluoridate or Not

At the recommended concentration of 0.8-1.0 mg/L, fluoride reduces cavities by 18-40%, and there is little risk of fluorosis unless other exposures (e.g. toothpaste, rinses, mouthwash, etc.) are swallowed. Opposition raises concerns that the intake is not easily controlled, and that children, and others may be more susceptible to health problems. However, public health experts strongly support fluoridation as an effective measure to prevent dental caries at the community level and reduce dental health inequities

The Walkerton Tragedy

In May 2000, the drinking water system in the town of Walkerton, ON, became contaminated with *Escherichia coli* O157:H7 and *Campylobacter jejuni*. Over 2,300 individuals became ill; 27 people developed hemolytic uremic syndrome and 7 individuals died in the outbreak

Source: Ministry of the Attorney General. Report of the Walkerton inquiry. Ontario, 2002

Water

Biological Hazards

- mostly due to human and animal waste
- Aboriginal Canadians, rural Canadians at higher risk
- bacteria: *Escherichia coli* (e.g. Walkerton, ON), *Salmonella*, *Pseudomonas*, *Shigella*
- protozoa: *Giardia*, *Cryptosporidium* (e.g. North Battleford, SK)

Chemical/Industrial Hazards

- chlorination by-products (e.g. chloroform can cause cancer at high levels)
- volatile organic compounds, heavy metals, pesticides, and other industrial waste products can be present in groundwater
- fluoride at high levels (greater than that of municipal fluoridation) can cause skeletal fluorosis

Soil

Biological Hazards

- biological contamination: tetanus, *Pseudomonas*

Chemical Hazards

- contamination sources: rupture of underground storage tanks, use of pesticides and herbicides, percolation of contaminated water runoffs, leaching of wastes from landfills, dust from smelting and coal burning power plants, residue of industrial waste/development (e.g. urban agriculture), lead deposition, leakage of transformers
- most common chemicals: petroleum hydrocarbons, solvents, lead, pesticides, motor oil, other industrial waste products
- health effects
- infants and toddlers at highest risk of exposure due to hand-mouth behaviours
- dependent on contaminant: leukemia, kidney damage, liver toxicity, neuromuscular blockade, developmental damage to the brain and nervous system, skin rash, eye irritation, headache, nausea, fatigue

Food

Biological Hazards

Table 11. Comparison of Select Biological Contaminants of Food and Effects on Human Health

	Source	Effects
<i>Salmonella</i>	Raw eggs, poultry, meat	GI symptoms
<i>Campylobacter</i>	Raw poultry, raw milk	Joint pain, GI symptoms
<i>Escherichia coli</i>	Various including meat, sprouts Primarily undercooked hamburger meat	Watery or bloody diarrhea Hemolytic uremic syndrome (esp. children)
<i>Listeria monocytogenes</i>	Unpasteurized cheeses, prepared salads, cold cuts	Listeriosis: nausea, vomiting, fever, headache, rarely meningitis or encephalitis
<i>Clostridium botulinum</i>	Unpasteurized honey, canned foods	Dizziness, weakness, respiratory failure, GI symptoms: thirst, nausea, constipation
Prion (BSE*)	Beef and beef products	Creutzfeldt-Jakob disease

*BSE = bovine spongiform encephalopathy

- other biological food contaminants include
 - viruses, mould toxins (e.g. aflatoxin has been associated with liver cancer), parasites (e.g. Toxoplasmosis, tapeworm), paralytic and shellfish poisoning (rare), genetically modified organisms (controversial as to health risks/benefits)

Chemical Hazards

many persistent organic pollutants are fat-soluble and undergo bioamplification

- drugs (antibiotics, hormones)
- inadequately prepared herbal medications
- food additives and preservatives
 - nitrites highest in cured meats; can be converted to carcinogenic nitrosamines
 - sulphites commonly used as preservatives; associated with sulphite allergy (hives, nausea, shock)
- pesticide residues
 - older pesticides (e.g. DDT) have considerable human health effects
- polychlorinated biphenyls (PCBs)
 - effects (severe acne, numbness, muscle spasm, bronchitis) much more likely to be seen in occupationally exposed individuals than in the general population
- dioxins and furans
 - levels highest in fish and marine mammals, also present in breast milk
 - can cause immunosuppression, liver disease, respiratory disease

Occupational Health

- occupational health is the maintenance and promotion of health in the work environment
- services encompass health promotion and protection (primary prevention), disease prevention (secondary prevention), and treatment and rehabilitation (tertiary prevention)
- general bias towards reporting occupational injuries versus occupational disease, as occupational disease is harder to identify

Taking an Occupational Health History

- current and previous job duties
- exposures
 - identification: screen for chemical, metal, dust, biological, and physical hazards as well as psychological stressors; review relevant workplace MSDS
 - assessment: duration, concentration, route, exposure controls (e.g. ventilation, personal protective equipment)
- temporal relationship: changes in symptoms in relationship to work environment
- presence of similar symptoms in co-workers
- non-work exposures: home, neighbourhood, hobbies

Honey and Botulism

Although exceedingly rare, infant botulism has been documented as a form of food poisoning from *C. botulinum* found in honey. When an infant swallows spores of this bacterium, they grow and produce a toxin in the baby's intestine. By the time an infant is 1, its gut has a healthy colony of "good" bacteria that prevents this from occurring

Organic Foods

- Foods designated as "organic" in Canada must conform to the Organic Products Regulations enforced by the Canadian Food Inspection Agency
- Organic foods are not free of synthetic pesticide residues but typically contain smaller amounts compared to conventionally grown foods
- Currently, there has not been strong evidence to suggest that eating organic foods is safer or more nutritious compared to eating conventionally grown food

Source: Organic foods. *Ann Intern Med* 2012;157:348-66. Health Canada. Pesticides and food, 2011. UpToDate. Organic foods and children, 2009

Most Effective

Elimination

Physically remove hazard

eg. driverless car

Substitution

Replace Hazard

eg. replace with train

Engineering Controls

Isolate from Hazard

eg. airbags

Administrative Controls

Change the way people work

eg. traffic laws

PPE

Protect worker with protective equipment

eg. seatbelts

Least Effective

©Kristen Browne 2016

Figure 18. Hierarchy of controls for reduction of occupational exposures

Source: Modified from CDC. 2015. Hierarchy of controls. <http://www.cdc.gov/niosh/topics/hierarchy/>

Occupational Hazards

Table 12. Occupational Hazards

Physical	Chemical	Biological	Psychosocial
<ul style="list-style-type: none"> • Trauma (e.g. fractures, lacerations) • Noise (e.g. hearing loss) • Temperature <ul style="list-style-type: none"> • heat cramps, heat exhaustion, heat stroke • hypothermia, frostbite • Air pressure (barotrauma, decompression sickness) • Ergonomic <ul style="list-style-type: none"> • repetitive use/overuse injuries, excessive force, awkward postures, poorly designed physical work environment • tenosynovitis, bursitis, carpal tunnel syndrome • Radiation <ul style="list-style-type: none"> • non-ionizing: visible light, infrared • ionizing: UV, x-rays, γ rays • Electricity 	<ul style="list-style-type: none"> • Organic solvents (e.g. benzene, methyl alcohol; most toxic is carbon tetrachloride) • Mineral dusts (e.g. silica leads to silicosis and predisposition to TB, asbestos leads to diffuse fibrosis and mesothelioma, coal leads to pneumoconiosis) • Heavy metals (e.g. nickel, cadmium, mercury, lead) • Gases (e.g. halogen gases, sulphur dioxide, carbon monoxide, nitrogen oxides) • Second-hand smoke (causal factor for lung cancer, lung disease, heart disease, asthma exacerbations; may be linked to miscarriage) • Skin diseases (major portion of compensations, e.g. contact dermatitis, occupational acne, pigmentation disorders) 	<ul style="list-style-type: none"> • Exposure to bacteria, viruses, fungi, protozoa, Rickettsia • Blood should be considered a potentially toxic substance due to blood-borne infectious diseases (e.g. HIV, hepatitis B) • Consider exposure to disease in endemic countries, travelers from endemic countries, or recent travel history in the setting of acute onset of symptoms (e.g. malaria, SARS, TB) 	<ul style="list-style-type: none"> • Workload stressors <ul style="list-style-type: none"> • responsibility • fear of job loss • geographical isolation • shift work • bullying • harassment (sexual/non-sexual) • Incurs high cost from absenteeism, poor productivity, mental illness (e.g. post-traumatic stress disorder)

Workplace Legislation

- universal across Canada for corporate responsibility in the workplace: due diligence, application of Workplace Hazardous Materials Information System (WHMIS), existence of joint health and safety committees in the workplace with representatives from workers and management
- jurisdiction in Canada is provincial (90% of Canadian workers), except for 16 federally regulated industries (e.g. airports, banks, highway transport) under the *Canada Labour Code*
- Ontario's *Occupational Health and Safety Act*
 - sets out rights of workers and duties of employers, procedures for dealing with workplace hazards, and law enforcement
 - workers have the right to
 - ♦ **participate** (e.g. have representatives on joint health and safety committees)
 - ♦ **know** (e.g. be trained and have information about workplace hazards)
 - ♦ **refuse work** (e.g. workers can decline tasks they feel are overly dangerous)
 - note: For some occupations, this right is restricted if, for example, danger/risk is normal part of work or refusal would endanger others (e.g. police, firefighters, some health care workers)
 - ♦ **stop work** (e.g. 'certified' workers can halt work they feel is dangerous to other workers)
 - employers must take precautions to protect the health and safety of employees and investigate concerns
 - enforced by Ministry of Labour via inspectors
- *Health Protection and Promotion Act (HPPA)* (Ontario)
 - Medical Officer of Health has right to investigate and manage health hazards where workplace exposures may impact non-workers (e.g. community members living close to the work site)

Workplace Health Promotion and Protection

- take action in the workplace so the worker is protected from injury or illness
 - identifying workplace hazards (e.g. through material safety data sheets [MSDS])
 - assessing risk
 - reducing exposure : changes to work environment including elimination, substitution, and isolation of hazard (e.g. engineering controls) more effective than changes to how people work (e.g. administrative controls) and personal protective equipment

Workplace Disease Prevention and Identification

- monitor workers' health to prevent the development of disease
 - periodic examinations to facilitate pre-symptomatic diagnosis
 - ♦ PFT for asthma (e.g. occupational dust exposure)
 - ♦ audiograms for hearing loss (e.g. occupational noise exposure)
 - substance misuse screening where performance impairment is suspected
- work up and diagnose presenting occupational health problems with appropriate laboratory and radiologic investigations

Ontario's *Workplace Safety and Insurance Act* (Each province will have their own similar legislation)

- Establishes Workplace Safety and Insurance Board (WSIB), an autonomous government agency that oversees workplace safety training and administers insurance for workers and employers
- WSIB decides benefits for workers, which may include reimbursement for
 - Loss of earned income
 - Non-economic loss (e.g. physical, functional, or psychological loss extending beyond the workplace)
 - Loss of retirement income
 - Health care expenses (e.g. first-aid, medical treatment)
 - Survivor benefits (e.g. dependents and spouses can receive benefits)
- Employers pay for costs (e.g. no government funding)
- No-fault insurance (e.g. worker has no right to sue the employer) in return for guaranteed compensation for accepted claims
- Negligence is not considered a factor
- Physicians are required to provide the WSIB with information about a worker's health without a medical waiver once a claim is made

For more information: <http://www.wsib.on.ca/en/community/WSIB>

Occupational Health Statistics

- 1 in 68 employed workers in 2010 received workers compensation due to injury or harm on the job
- 4,405 fatal work injuries in the United States in 2013; rate = 3.2/100,000 workers

Source: Employment and Social Development Canada. Work-related injuries, 2015

U.S. Bureau of Labour Statistics. Census of Fatal Occupational Injuries Charts, 1992-2013, 2014

Taking an Occupational Health Hx

WHACS

What do you do?

How do you do it?

Are you concerned about any particular exposures on or off the job?

Co-workers or others with similar problems?

Satisfied with your job?

J Occup Environ Med 1998;40:680-684

Workplace Treatment and Rehabilitation

- treat injury or illness with safe return to the workplace
- may require rehabilitation, retraining, change in job duties, and/or workers' compensation (WSIB)
- advise relevant authorities if necessary (e.g. report notifiable diseases to public health, conditions impeding driving to Ministry of Transportation, see [Appendix](#), PH25)

Appendix – Mandatory Reporting

Reportable Diseases

As an essential part of the health system, physicians in Canada are required by law to report certain diseases to public health for the following reasons

1. to control the outbreak
 - if the disease presents an outbreak threat (e.g. measles, *Salmonella*, respiratory diseases in institutions)
2. to prevent spread
 - if the disease presents a significant threat to individuals or a subset of the population (e.g. Lassa Fever)
3. for surveillance
 - if the disease is preventable with immunization (e.g. polio, diphtheria, congenital rubella)
4. if infected individuals require education, treatment and/or partner notification (e.g. gonorrhea, TB)
5. reporting details (website, office etc.)
 - some are more urgent than others (must contact MOH)
 - physicians should also report unlisted diseases that appear in clusters

The following list is based on the reportable diseases in Ontario for 2014. Each province will have similar legislation

Source: Health Protection and Promotion Act, O. Reg. 559/91, amended to O. Reg.49/07

Acquired Immunodeficiency Syndrome (AIDS)	<i>Haemophilus influenzae b</i> disease, invasive	Rabies
Acute flaccid paralysis <15 yr	Hantavirus pulmonary syndrome	Respiratory infection outbreaks in institutions
Amoebiasis	Hemorrhagic fevers, including:	Rubella
Anthrax	i. Ebola virus disease	Rubella, congenital syndrome
	ii. Marburg virus disease	
	iii. Other viral causes	
Botulism	Hepatitis, viral:	Salmonellosis
Brucellosis	i. Hepatitis A	Severe Acute Respiratory Syndrome (SARS)
	ii. Hepatitis B	Shigellosis
<i>Campylobacter</i> enteritis	iii. Hepatitis C	Smallpox
Chancroid	iv. Hepatitis D (Delta hepatitis)	Streptococcal infections, Group A invasive
Chickenpox (Varicella)	Herpes, neonatal	Streptococcal infections, Group B neonatal
<i>Chlamydia trachomatis</i> infections	Human Immunodeficiency Virus (HIV)	Syphilis
Cholera		
<i>Clostridium difficile</i> associated disease (CDAD) outbreaks in public hospitals	Influenza	Tetanus
Cryptosporidiosis	Lassa Fever	Transmissible spongiform encephalopathy, including:
Cyclosporiasis	Legionellosis	i. Creutzfeldt-Jakob disease, all types
Cytomegalovirus infection, congenital	Leprosy	ii. Gerstmann-Sträussler-Scheinker syndrome
	Listeriosis	iii. Fatal familial insomnia
Diphtheria	Lyme Disease	iv. Kuru
		Trichinosis
Encephalitis, including:	Malaria	Tuberculosis, active and latent
i. Primary, viral	Measles	Tularemia
ii. Post-infectious	Meningitis, acute:	Typhoid Fever
iii. Vaccine-related	i. Bacterial	
iv. Subacute sclerosing panencephalitis	ii. Viral	Verotoxin-producing <i>E. coli</i> infection
v. Unspecified	iii. Other	indicator conditions, including Hemolytic Uremic Syndrome (HUS)
	Meningococcal disease, invasive	
Food poisoning, all causes	Mumps	
		West Nile Virus illness, including:
Gastroenteritis, institutional outbreaks	Ophthalmia neonatorum	i. West Nile fever
Giardiasis, except asymptomatic cases	Paralytic shellfish poisoning	ii. West Nile neurological manifestations
Gonorrhea	Paratyphoid fever	
	Pertussis (whooping cough)	
	Plague	Yellow Fever
	Pneumococcal disease, invasive	Yersiniosis
	Poliomyelitis, acute	
	Psittacosis/Ornithosis	
	Q Fever	

Other Reportable Conditions

In addition to reporting diseases, physicians have a legal responsibility to report certain conditions. The list below highlights some reportable conditions for Ontario, but is not exhaustive. See your jurisdiction's regulatory body for the full list

Child Abuse – to local Children's Aid Society (CAS)

- all child abuse and neglect where reasonable grounds to suspect exist (including physical harm, emotional harm, sexual harm, and neglect)
- duty to report is ongoing: if additional reasonable grounds are suspect, a further report to CAS is necessary

Unfit to Drive – to provincial Ministry of Transportation

- all patients with a medical condition (e.g. dementia, untreated epilepsy) that may impede their driving ability
- if a physician does not report and the driver gets into an accident, the physician may be held liable

Unfit to Fly – to federal Ministry of Transportation

- all patients believed to be flight crew members or air traffic controller with a medical or optometric condition that is likely to constitute a hazard to aviation safety

Gunshots Wounds – to local police service

- all patients with a gunshot or stab wounds
- self-inflicted knife wounds are not reportable

Psychiatric Assessment

History

Identifying Data

- necessary: name, sex, age, ethnicity, marital status, occupation/source of financial support, place and type of residency
- adjunct: makeup of household, religion, education, referral source, known or unknown to treatment team

Reliability of Patient as a Historian

- Indicate if, and for what content, collateral source used (e.g. parent, teacher) if patient unable/unwilling to cooperate

Chief Complaint

- in patient's own words, duration

History of Present Illness

- reason for seeking help (that day), current symptoms (onset, duration and course), stressors, supports, functional status, relevant associated symptoms (pertinent positives and negatives)
- safety screen: is the patient endangering self or others? dependants at home (e.g. children, pets), ability to drive safely, ability to care for self (e.g. eating, hygiene, taking medications)

Psychiatric Functional Inquiry

- mood: depression, mania
- anxiety: worries, obsessions, compulsions, panic attacks, phobias, history of trauma
- psychosis: hallucinations, delusions
- suicide/homicide: ideation, plan, intent, history of attempts (see [Suicide](#), PS4)
- organic: EtOH/drug use or withdrawal, illness, dementia

Past Psychiatric History

- all previous psychiatric diagnoses, psychiatric contacts, treatments (pharmacological and non-pharmacological), and hospitalizations
- include past suicide attempts, substance use/abuse, and legal problems

Past Medical/Surgical History

- all medical, surgical, neurological (e.g. head trauma, seizures), and psychosomatic illnesses
- current medications, allergies

Family Psychiatric/Medical History

- family members: ages, occupations, personalities, medical or genetic illnesses and treatments, relationships with parents/siblings
- family psychiatric history: any past or current psychiatric illnesses and hospitalizations, suicide, substance abuse

Past Personal/Developmental History (as relevant)

- prenatal and perinatal history (desired vs. unwanted pregnancy, maternal and fetal health, domestic violence, maternal substance use, complications of pregnancy/delivery)
- early childhood to age 3 (developmental milestones, activity/attention level, family stability, attachment figures)
- middle childhood to age 11 (school performance, peer relationships, fire-setting, stealing, incontinence)
- late childhood to adolescence (drug/alcohol, legal problems, peer and family relationships)
- physical or sexual abuse in childhood/adolescence
- adulthood (education, occupations, relationships)
- personality before current illness, recent changes in personality
- psychosexual history (puberty, first sexual encounter, romantic relationships, gender roles, sexual dysfunction)

Screening Questions for Major Psychiatric Disorders

- Have you been feeling down, depressed or hopeless?
- Do you feel anxious or worry about things?
- Has there been a time in your life where you have felt euphoric, extremely talkative, had a lot of energy, and a decreased need for sleep?
- Do you see or hear things that you think other people cannot?
- Have you ever thought of harming yourself or committing suicide?

Psychiatric Functional Inquiry

MOAPS

Mood

Organic (e.g. substances and organic disease)

Anxiety

Psychosis

Safety

Always Remember to Ask About Abuse
See [Family Medicine](#), FM27

Mental Status Exam

General Appearance

- dress, grooming, posture, gait, physical characteristics, body habitus, apparent vs. chronological age, facial expression (e.g. sad, suspicious), tattoos, piercings (if numerous or atypical), acute distress or relaxed

Behaviour

- psychomotor activity (agitation, retardation), abnormal movements or lack thereof (tremors, akathisia, tardive dyskinesia, paralysis), attention level and eye contact, attitude toward examiner (ability to interact, level of cooperation)

Speech

- rate (e.g. pressured, slowed), rhythm/fluency, volume, tone, articulation, quantity, spontaneity

Mood and Affect

- mood: subjective emotional state (in patient's own words)
- affect: objective emotional state inferred from emotional responses to stimuli; described in terms of
 - quality (euthymic, depressed, elevated, anxious, irritable)
 - range (full, restricted, flat, blunted)
 - stability (fixed, labile)
 - mood congruence (inferred by reader by comparing mood and affect descriptions)
 - appropriateness to thought content
- some clinicians use 0-10 scales when rating mood to help get a subjective norm for each patient that can help establish changes over time and with treatment

Thought Process/Form

- coherence (coherent, incoherent)
- logic (logical, illogical)
- stream
 - goal-directed: clearly answers questions in a linear, organized, logical fashion
 - circumstantial: speech that is indirect and delayed in reaching its goal; eventually comes back to the point
 - tangential: speech is oblique or irrelevant; does not come back to the original point
 - loosening of associations/derailment: illogical shifting between topics
 - flight of ideas: quickly skipping from one idea to another where the ideas are marginally connected, usually associated with mania
 - word salad: jumble of words lacking meaning or logical coherence
- perseveration: repetition of the same verbal or motor response to stimuli
- echolalia: repetition of phrases or words spoken by someone else
- thought blocking: sudden cessation of flow of thought and speech
- clang associations: speech based on sound such as rhyming or punning
- neologism: use of novel words or of existing words in a novel fashion

Thought Content

- suicidal ideation/homicidal ideation
 - frequency and pervasiveness of thoughts, formulation of plan, means to plan, intent, active vs. passive, protective factors
- preoccupations, ruminations: reflections/thoughts at length, not fixed or false
- obsession: recurrent and persistent thought, impulse, or image which is intrusive or inappropriate and unwanted
 - cannot be stopped by logic or reason
 - causes marked anxiety and distress
 - common themes: contamination, orderliness, sexual, pathological doubt/worry/guilt
- magical thinking: belief that thinking something will make it happen; normal in children and certain cultures
- ideas of reference: similar to delusion of reference, but less fixed (the reality of the belief is questioned)
- overvalued ideas: unusual/odd beliefs that are not of delusional proportions
- first rank symptoms of schizophrenia: thought insertion/withdrawal/broadcasting
- delusion: a fixed false belief that is out of keeping with a person's cultural or religious background and is firmly held despite incontrovertible proof to the contrary

Perception

- hallucination: sensory perception in the absence of external stimuli that is similar in quality to a true perception
 - auditory (most common), visual, gustatory, olfactory, tactile
- illusion: misperception of a real external stimulus (such as mistaking a coat on a rack as a person late at night)
- depersonalization: change in self-awareness such that the person feels unreal, distant, or detached from his or her body, and/or unable to feel emotion
- derealization: feeling that the world/outer environment is unreal

Mental Status Exam

ASEPTIC

Appearance and behaviour
Speech
Emotion (mood and affect)
Perception
Thought content and process
Insight and judgment
Cognition

The MSE is analogous to the physical exam. It focuses on current signs, affect, behaviour, and cognition

Spectrum of Affect

Full > Restricted > Blunted > Flat

There is poor correlation between clinical impression of suicide risk and frequency of attempts

Cognitive Assessment

Use MMSE to assess

- Orientation (time and place)
- Memory (immediate and delayed recall)
- Attention and concentration
- Language (comprehension, reading, writing, repetition, naming)
- Spatial ability (intersecting pentagons)

Gross screen for cognitive dysfunction:
Total score is out of 30; <26 abnormal, 20-26 mild, 10-19 moderate, <10 severe

The key to differentiating obsessions and delusions is that obsessions are usually ego dystonic, meaning unwanted and not fitting in with a person's goals and self-image, while delusions are ego syntonic

Hallucinations other than auditory should prompt a consideration of organic causes

Delusions

- Persecutory: belief that others are trying to cause harm to you
- Reference: interpreting publicly known events/celebrities as having direct reference to you
- Erotomania: belief that another is in love with you
- Grandiose: an inflated sense of self-worth or power
- Religious: belief of receiving instructions/powers from a higher being; of being a higher being
- Somatic: belief that you have a physical disorder/defect
- Nihilistic: belief that things do not exist; a sense that everything is unreal

Cognition

- level of consciousness (alert, reduced, obtunded)
- orientation: time, place, person
- memory: immediate, recent, remote
- global evaluation of intellect (below average, average, above average, in keeping with person's education)
- intellectual functions: attention, concentration, calculation, abstraction (proverb interpretation, similarities test), language, communication
- MMSE/MOCA useful as standardized assessment of cognition

Insight

- patient's ability to realize that he or she has a physical or mental illness and to understand its implications (no, limited, partial, full)

Judgment

- patient's ability to understand relationships between facts and draw conclusions that determine one's actions

Assessing Insight and Judgment

Insight

- Do you think that you have a mental illness?
- Why are you taking this medication?
- Why are you in the hospital?

Judgment

Can be observed from collected history and patient's appearance and actions

- Is he/she dressed appropriately for the weather?
- Is he/she acting appropriately in the given situation?
- Is he/she taking care of self and/or dependents?

Assessment and Plan

Historical Multiaxial Model

- since DSM-5, this Model is no longer used for psychiatric diagnosis. Instead, relevant psychiatric and medical diagnoses are simply listed. Nevertheless, we offer it here as a possible framework for psychiatric patient assessment, as many physicians still employ it.

Multiaxial Assessment

- Axis I: differential diagnosis of DSM-5 clinical disorders
- Axis II: personality disorders, developmental disability
- Axis III: general medical conditions potentially relevant to understanding/management of the mental disorder
- Axis IV: psychosocial and environmental issues
- Axis V: Global Assessment of Functioning (GAF, 0 to 100) incorporating effects of axes I to IV

After History and MSE, the assessment and plan is recorded

Assessment/Problem Formulation

- identify predominant symptom cluster (mood, anxiety, psychosis, organic) - causing the most distress/interference, persist when other symptom categories not present (e.g. psychosis in the absence of mood symptoms)
- dominating symptoms will direct differential
- consider current issues as they relate to an individual's factors in three domains: biological, psychological, and social
- for each category: predisposing, precipitating, perpetuating, and protecting factors are considered

Approach to Management

- consider short-term and long-term, and three types: biological (e.g. pharmacotherapy), psychological (e.g. CBT), and social (e.g. support group)

Suicide

Importance

- absolutely must be screened for in every encounter; part of risk assessment along with violent/homicidal ideation

Approach

- ask every patient – e.g. “Have you had any thoughts of wanting to kill yourself?”
- classify ideation
 - passive ideation: would rather not be alive but has no active plan for suicide
 - ♦ e.g. “I’d rather not wake up” or “I would not mind if a car hit me”
 - active ideation
 - ♦ e.g. “I think about killing myself”
- assess risk
 - plan: “Do you have a plan as to how you would end your life?”
 - intent: “Do you think you would actually carry out this plan?” “If not, why not?”
 - past attempts: highest risk if previous attempt in past year
 - ♦ ask about lethality, outcome, medical intervention
- assess suicidal ideation
 - onset and frequency of thoughts: “When did this start?” or “How often do you have these thoughts?”

- control over suicidal ideation: "How do you cope when you have these thoughts?" "Could you call someone for help?"
- intended lethality: "Do you want to end your life?" or "What do you think would happen if you actually took those pills?"
- access to means: "How will you get a gun?" or "Which bridge do you think you would go to?"
- time and place: "Have you picked a date and place? Is it in an isolated location?"
- provocative factors: "What makes you feel worse (e.g. being alone)?"
- protective factors: "What keeps you alive (e.g. friends, family, pets, faith, therapist)?"
- final arrangements: "Have you written a suicide note? Made a will? Given away your belongings?"
- practiced suicide or aborted attempts: "Have you ever put the gun to your head?" "Held the medications in your hand?" "Stood at the bridge?"
- ambivalence: "I wonder if there is a part of you that wants to live, given that you came here for help?"

Assessment of Suicide Attempt

- setting (isolated vs. others present/chance of discovery)
- planned vs. impulsive attempt, triggers/stressors
- substance use/intoxication
- medical attention (brought in by another person vs. brought in by self to ED)
- time lag from suicide attempt to ED arrival
- expectation of lethality, dying
- reaction to survival (guilt/remorse vs. disappointment/self-blame)

Epidemiology

- attempted:completed = 20:1
- M:F = 1:4 for attempts, 3:1 for completed

Risk Factors

- epidemiologic factors
 - age: increases after age 14, second most common cause of death for ages 15-24, highest rates in persons >65 yr
 - sex: male
 - race/ethnic background: white or Native Canadians on reserves
 - marital status: widowed/divorced
 - living situation: alone; no children <18 yr old in the household
 - other: stressful life events, access to firearms
- psychiatric disorders
 - mood disorders (15% lifetime risk in depression; higher in bipolar)
 - anxiety disorders (especially panic disorder)
 - schizophrenia (10-15% risk)
 - substance abuse (especially alcohol – 15% lifetime risk)
 - eating disorders (5% lifetime risk)
 - adjustment disorder
 - conduct disorder
 - personality disorders (borderline, antisocial)
- past history
 - prior suicide attempt
 - family history of suicide attempt/completion

Clinical Presentation

- symptoms associated with suicide
 - hopelessness
 - anhedonia
 - insomnia
 - severe anxiety
 - impaired concentration
 - psychomotor agitation
 - panic attacks

Management

- proper documentation of the clinical encounter and rationale for management is essential
- higher risk (hospitalization needs to be strongly considered)
 - patients with a plan and intention to act on the plan, access to lethal means, recent social stressors, and symptoms suggestive of a psychiatric disorder
 - do not leave patient alone; remove potentially dangerous objects from room
 - if patient refuses to be hospitalized, complete form for involuntary admission (Form 1)
- lower risk
 - patients who are not actively suicidal, with no plan or access to lethal means

Suicide Risk Factors

SAD PERSONS

Sex (male)
Age >60 yr old
Depression
Previous attempts
Ethanol abuse
Rational thinking loss (delusions, hallucinations, hopelessness)
Suicide in family
Organized plan
No spouse (no support systems)
Serious illness, intractable pain

Suicidal Ideation Assessment

- Asking patients about suicide will not give them the idea or the incentive to commit suicide
- The best predictor of completed suicide is a history of attempted suicide
- The most common psychiatric disorders associated with completed suicide are mood disorders and alcohol abuse

- discuss protective factors and supports in their life, remind them of what they live for, promote survival skills that helped them through previous suicide attempts
- make a safety plan that could include an agreement that they will:
 - not harm themselves
 - avoid alcohol, drugs, and situations that may trigger suicidal thoughts
 - follow-up with you at a designated time
 - contact a health care worker, call a crisis line, or go to an emergency department if they feel unsafe or if their suicidal feelings return or intensify
- depression: consider hospitalization if symptoms severe or if psychotic features are present; otherwise outpatient treatment with good supports and SSRIs/SNRIs
- alcohol-related: usually resolves with abstinence for a few days; if not, suspect depression
- personality disorders: crisis intervention, may or may not hospitalize
- schizophrenia/psychosis: hospitalization might be necessary
- parasuicide/self-mutilation: long-term psychotherapy with brief crisis intervention when necessary

Psychotic Disorders

Definition

- characterized by a significant impairment in reality testing
- delusions or hallucinations (with/without insight into their pathological nature) behaving in a disorganized way so that it is reasonable to infer that reality testing is disturbed

Delusions: fixed, false beliefs
Hallucinations: perceptual experiences without an external stimulus

Differential Diagnosis of Psychosis

Approach

- to differentiate among psychotic disorders and distinguish them from other primary diagnoses with psychotic features,
- consider symptoms, persistence, and time
- symptoms: what symptoms exist? The primary diagnosis needs full criteria to be met
 - mood: depressive episodes with psychotic features, manic episodes with psychotic features
 - psychotic: consider symptoms in Criterion A of schizophrenia, such as delusions, hallucinations, disorganized speech, grossly disorganized/catatonic behaviour, negative symptoms (i.e. diminished emotional expression or avolition)
- persistence: is there a time when certain symptom clusters are present without other clusters?
 - e.g. if there is a period of time with mood symptoms but not psychotic symptoms, consider mood disorder
 - e.g. if two weeks where psychotic symptoms persist in the absence of mood symptoms, consider schizoaffective disorder
- time: how long have the symptoms been present?

Differential

- primary psychotic disorders: schizophrenia, schizophreniform, brief psychotic, schizoaffective, delusional disorder
- mood disorders: depression with psychotic features, bipolar disorder (manic or depressive episode with psychotic features)
- personality disorders: schizotypal, schizoid, borderline, paranoid, obsessive-compulsive
- general medical conditions: tumour, head trauma, dementia, delirium, metabolic, infection, stroke, temporal lobe epilepsy
- substance-induced psychosis: intoxication or withdrawal, prescribed medications, toxins

Table 1. Differentiating Psychotic Disorders

Disorder	Psychotic Symptoms	Duration
Brief Psychotic Disorder	≥1 positive symptoms of criterion A	<1 mo
Schizophreniform Disorder	Criterion A	1-6 mo
Schizophrenia	Criterion A	>6 mo
Schizoaffective Disorder	Criterion A + major mood episode, but ≥2 wk psychotic without mood symptoms	>1 mo
Delusional Disorder	Non-bizarre delusions, hallucinations	>1 mo
2° to Substance Intoxication/Withdrawal	Delusions or hallucinations	During intoxication/withdrawal, not > 1 mo without use
2° to Mood Disorder	Mood symptoms dominant + delusions/hallucinations (mood congruent)	Psychosis may be present for the duration of the mood episode

Duration of Time Differentiates the following 3 Psychotic Disorders

Brief Psychotic Disorder	Schizophreniform Disorder	Schizophrenia
<1 month	1-6 months	>6 months

Figure 1. Differentiating psychotic disorders with duration

Management of Acute Psychosis and Mania

- Ensure safety of self, patient, and other patients
- Have an exit strategy
- Decrease stimulation
- Assume a non-threatening stance
- IM medications (benzodiazepine + antipsychotic) often needed as patient may refuse oral medication
- Physical restraints may be necessary
- Do not use antidepressants or stimulants

Schizophrenia

DSM-5 Diagnostic Criteria for Schizophrenia

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, 5th ed. 2013. American Psychiatric Association

- A. two (or more) of the following, each present for a significant portion of time during a 1 mo period (or less if successfully treated). At least one of these must be (1), (2), or (3)
 1. delusions
 2. hallucinations
 3. disorganized speech (e.g. frequent derailment or incoherence)
 4. grossly disorganized or catatonic behaviour
 5. negative symptoms (i.e. diminished emotional expression or avolition)
 - B. decreased level of function: for a significant portion of time since onset, one or more major areas affected (e.g. work, interpersonal relations, self-care) is markedly decreased (or if childhood/adolescent onset, failure to achieve expected level)
 - C. at least 6 mo of continuous signs of the disturbance. Must include at least 1 mo of symptoms (or less if successfully treated) that meet Criterion A (i.e. active-phase symptoms) and may include periods of prodromal or residual symptoms (during which, disturbance may manifest by only negative symptoms or by two or more Criterion A symptoms present in an attenuated form (e.g. odd beliefs, unusual perceptual experiences))
 - D. rule out schizoaffective disorder and depressive or bipolar disorder with psychotic features because either 1) no major depressive or manic episodes have occurred concurrently with the active-phase symptoms, or 2) if mood episodes have occurred during active-phase symptoms, they have been present for a minority of the total duration of the active and residual periods of the illness
 - E. rule out other causes: GMC, substances (e.g. drug of abuse, medication)
 - F. if history of autism spectrum disorder or communication disorder of childhood onset, the additional diagnosis of schizophrenia is made only if prominent delusions or hallucinations are also present for at least 1 mo (or less if successfully treated)
- **specifiers:** type of episode (e.g. first episode, multiple episodes, continuous), with catatonia, current severity based on quantitative assessment of primary symptoms of psychosis (in acute episode, in partial remission, in full remission)

Epidemiology

- prevalence: 0.3-0.7%, M:F = 1:1
- mean age of onset: females late-20s; males early- to mid-20s
- suicide risk: 10% die by suicide, 30% attempt suicide

Etiology

- multifactorial: disorder is a result of interaction between both biological and environmental factors
 - genetic: 40% concordance in monozygotic (MZ) twins; 46% if both parents have schizophrenia; 10% of dizygotic (DZ) twins, siblings, children affected; vulnerable genes include Disrupted-in-Schizophrenia 1 (DISC1); neuregulin 1 (NRG1); dystrobrevin binding protein / dysbindin (DTNBP1); catechol-O-methyltransferase (COMT); d-amino acid oxidase activator (DAOA); metabotropic glutamate receptor 3 (GRM3); and brain-derived neurotrophic factor (BDNF)
 - neurochemistry ("dopamine hypothesis"): excess activity in the mesolimbic dopamine pathway may mediate the positive symptoms of psychosis, while decreased dopamine in the prefrontal cortex may mediate negative and cognitive symptoms. GABA, glutamate, and ACh dysfunction are also thought to be involved
 - neuroanatomy: decreased frontal lobe function; asymmetric temporal/limbic function; decreased basal ganglia function; subtle changes in thalamus, cortex, corpus callosum, and ventricles; cytoarchitectural abnormalities
 - neuroendocrinology: abnormal growth hormone, prolactin, cortisol, and ACTH
 - neuropsychology: global defects seen in attention, language, and memory suggest lack of connectivity of neural networks
 - environmental: indirect evidence of cannabis use, geographical variance, winter season of birth, obstetrical complications, and prenatal viral exposure

Pathophysiology

- neurodegenerative theory
- natural history may be a rapid or gradual decline in function and ability to communicate
- glutamate system may mediate progressive degeneration by excitotoxic mechanism which leads to production of free radicals
- neurodevelopmental theory: abnormal development of the brain from prenatal life
- neurons fail to migrate correctly, make inappropriate connections, and break down in later life
- inappropriate apoptosis during neurodevelopment resulting in faulty connections between neurons

Comorbidity

- substance-related disorders
- anxiety disorders
- decreased life expectancy because of associated medical conditions (e.g. weight gain, diabetes, metabolic syndrome, CV/pulmonary disease)

Disorganized Behaviours in Schizophrenia

- Catatonic stupor: fully conscious, but immobile, mute, and unresponsive
- Catatonic excitement: uncontrolled and aimless motor activity, maintaining bizarre positions for a long time
- Stereotypy: repeated but non-goal-directed movement (e.g. rocking)
- Mannerisms: goal-directed activities that are odd or out of context (e.g. grimacing)
- Echopraxia: imitates movements and gestures of another
- Automatic obedience: carries out simple commands in robot-like fashion
- Negativism: refuses to cooperate with simple requests for no apparent reason
- Inappropriate affect, neglect of self-care, other odd behaviours (random shouting)

Relationship Between Duration of Untreated Psychosis (DUP) and Outcome in First-Episode Schizophrenia

Am J Psychiatry 2005;162:1785-1804

Purpose: To review the association between DUP and symptom severity at first treatment contact, and between DUP and treatment outcomes.

Study Characteristics: Critical review and meta-analysis of 43 studies with 4,177 patients.

Participants: Patients with non-affective psychotic disorders at or close to first treatment.

Results: Shorter DUP was associated with greater response to antipsychotic treatment, as measured by global psychopathology, positive symptoms, negative symptoms, and functional outcomes. At the time of treatment initiation, longer DUP was associated with the severity of negative symptoms but not with the severity of positive symptoms, global psychopathology, or neurocognitive function.

Conclusions: DUP may be a potentially modifiable prognostic factor.

Management of Schizophrenia

- biological / somatic
 - acute treatment and maintenance: antipsychotics (haloperidol, risperidone, olanzapine, paliperidone; clozapine if refractory); often regimens of IM q2-4 weeks used in severe cases to ensure compliance
 - adjunctive: \pm mood stabilizers (for aggression/impulsiveness - lithium, valproate, carbamazepine) \pm anxiolytics \pm ECT
 - treat for at least 1-2 years after the first episode, at least 5 years after multiple episodes (relapse causes severe deterioration)
- psychosocial
- psychotherapy: individual, family (important), group: supportive, CBT (see Table 14, PS43)
 - ACT (Assertive Community Treatment): mobile mental health teams that provide individualized treatment in the community and help patients with medication adherence, basic living skills, social support, job placements, resources
 - social skills training, employment programs, disability benefits
 - housing (group home, boarding home, transitional home)

Course and Prognosis

- majority of individuals display some type of prodromal phase
- course is variable: some individuals have exacerbations and remissions and others remain chronically ill; accurate prediction of the long-term outcome is not possible
- negative symptoms may be prominent early in the illness and may become more prominent and more disabling later on; positive symptoms appear and typically diminish with treatment
- over time: 1/3 improve, 1/3 remain the same, 1/3 worsen

Good Prognostic Factors

- Acute onset
- Shorter duration of prodrome
- Female gender
- Good cognitive functioning
- Good premorbid functioning
- No family history
- Presence of affective symptoms
- Absence of structural brain abnormalities
- Good response to drugs
- Good support system

Schizophreniform Disorder

Diagnosis

- criteria A, D, and E of schizophrenia are met; but episode lasts for at least 1 mo but less than 6 mo
- if the symptoms have extended past 6 mo the diagnosis becomes schizophrenia
- **specifiers:** with/without good prognostic features (e.g. acute onset, confusion, good premorbid functioning, absence of blunt/flat affect), with catatonia, current severity based on quantitative assessment of primary symptoms of psychosis

Treatment

- similar to acute schizophrenia

Prognosis

- better than schizophrenia; begins and ends more abruptly; good pre- and post-morbid function

Brief Psychotic Disorder

Diagnosis

- criteria A1-A4, D, and E of schizophrenia are met; an episode of the disorder lasts for at least 1 d, but less than 1 mo with eventual full return to premorbid level of functioning
- **specifiers:** with/without marked stressors, with postpartum onset, with catatonia, current severity
- can occur after a stressful event or postpartum (see *Postpartum Mood Disorders*, PS12)

Treatment

- secure environment, antipsychotics, anxiolytics

Prognosis

- good, self-limiting, should return to pre-morbid function within 1 mo

Schizoaffective Disorder

DSM-5 Diagnostic Criteria for Schizoaffective Disorder (Reformatted)

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, 5th ed. 2013. American Psychiatric Association

- concurrent psychosis (criterion A of schizophrenia) and major mood episode - uninterrupted period of illness
 - delusions or hallucinations for 2 or more wk in the absence of a major mood episode during the lifetime duration of the illness
 - major mood episode symptoms are present for the majority of the total duration of the active and residual periods of the illness
 - the disturbance is not attributable to the effects of a substance or another medical condition
- **specifiers:** bipolar type, depressive type, with catatonia, type of episode, severity
 - one-third as prevalent as schizophrenia; schizoaffective disorder bipolar type more common in young adults, schizoaffective disorder depressive type more common in older adults
 - depressive symptoms correlated with higher suicide risk

Non-bizarre delusions involve situations that could occur in real life (e.g. being followed, poisoned, loved at a distance)

Treatment

- antipsychotics, mood stabilizers, antidepressants

Prognosis

- between that of schizophrenia and of mood disorder

Delusional Disorder

DSM-5 Diagnostic Criteria for Delusional Disorder

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, 5th ed. 2013. American Psychiatric Association

- A. the presence of one (or more) delusions with a duration of 1 mo or longer
- B. criterion A for schizophrenia has never been met
Note: hallucinations, if present, are not prominent and are related to the delusional theme
- C. apart from the impact of the delusion(s) or its ramifications, functioning is not markedly impaired, and behaviour is not obviously bizarre or odd
- D. if manic or major depressive episodes have occurred, these have been brief relative to the duration of the delusional periods
- E. the disturbance is not attributable to the physiological effects of a substance or another medical condition and is not better explained by another mental disorder
- **subtypes:** erotomanic, grandiose, jealous, persecutory, somatic, mixed, unspecified
- further specify: bizarre content, type of episode (e.g. first episode, multiple episode), severity

Treatment

- psychotherapy, antipsychotics, antidepressants

Prognosis

- chronic, unremitting course but high level of functioning; a portion will progress to schizophrenia

Mood Disorders

Definitions

- mood disorders are characterized by the presence of diagnosable mood episodes
- mood episodes represent a combination of symptoms comprising a predominant mood state that is abnormal in quality or duration (e.g. major depressive, manic, mixed, hypomanic). DSM-5 Criteria for mood episodes are listed below.
- types of mood disorders include
- depressive (major depressive disorder, persistent depressive disorder)
- bipolar (bipolar I/II disorder, cyclothymia)
- secondary to general medical condition, substances, medications, other psychiatric issue
- accurate diagnosis of a mood disorder requires a careful past medical and psychiatric history to detect past mood episodes and to rule out whether these episodes were secondary to substance use, a medical condition, a loss, etc.

Medical Workup of Mood Disorder

- routine screening: physical exam, CBC, thyroid function test, extended electrolytes, urinalysis, drug screen, medications list
- additional screening: neurological consultation, chest X-ray, ECG, CT head

Mood Episodes

DSM-5 Diagnostic Criteria for Major Depressive Episode

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, 5th ed. 2013. American Psychiatric Association

- A. ≥ 5 of the following symptoms have been present during the same 2 wk period and represent a change from previous functioning; at least one of the symptoms is either 1) depressed mood or 2) loss of interest or pleasure (anhedonia)
Note: Do not include symptoms that are clearly attributable to another medical condition
 - depressed mood most of the day, nearly every day, as indicated by either subjective report or observation made by others
 - markedly diminished interest or pleasure in all, or almost all, activities most of the day, nearly every day
 - significant and unintentional weight loss/weight gain, or decrease/increase in appetite nearly every day
 - insomnia or hypersomnia nearly every day
 - psychomotor agitation or retardation nearly every day
 - fatigue or loss of energy nearly every day
 - feelings of worthlessness or excessive or inappropriate guilt (which may be delusional) nearly every day (not merely self-reproach or guilt about being sick)

Criteria for Depression (≥ 5)

MSIGECAPS

Mood: depressed
Sleep: increased/decreased
Interest: decreased
Guilt
Energy: decreased
Concentration: decreased
Appetite: increased/decreased
Psychomotor: agitation/retardation
Suicidal ideation

- diminished ability to think or concentrate, or indecisiveness, nearly every day
- recurrent thoughts of death (not just fear of dying), recurrent suicidal ideation without a specific plan, or a suicide attempt or a specific plan for committing suicide
- B. the symptoms cause clinically significant distress or impairment in social, occupational, or other important areas of functioning
- C. the episode is not attributable to the direct physiological effects of a substance or a GMC

DSM-5 Criteria for Manic Episode

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, 5th ed. 2013. American Psychiatric Association

- A. a distinct period of abnormally and persistently elevated, expansive, or irritable mood and abnormally and persistently increased goal-directed activity or energy, lasting ≥ 1 wk and present most of the day, nearly every day (or any duration if hospitalization is necessary)
- B. during the period of mood disturbance and increased energy or activity, ≥ 3 of the following symptoms have persisted (4 if the mood is only irritable) and have been present to a significant degree and represent a noticeable change from usual behaviour
 - inflated self-esteem or grandiosity
 - decreased need for sleep (e.g. feels rested after only 3 h of sleep)
 - more talkative than usual or pressure to keep talking
 - flight of ideas or subjective experience that thoughts are racing
 - distractibility (i.e. attention too easily drawn to unimportant or irrelevant external stimuli)
 - increase in goal-directed activity (either socially, at work or school, or sexually) or psychomotor agitation
 - excessive involvement in pleasurable activities that have a high potential for painful consequences (e.g. engaging in unrestrained shopping sprees, sexual indiscretions, or foolish business investments)
- C. the mood disturbance is sufficiently severe to cause marked impairment in social or occupational functioning or to necessitate hospitalization to prevent harm to self or others, or there are psychotic features
- D. the episode is not attributable to the physiological effects of a substance or another medical condition

Note: A full manic episode that emerges during antidepressant treatment but persists at a fully syndromal level beyond the physiological effect of that treatment is sufficient evidence for a manic episode, and therefore, a bipolar I diagnosis

Note: Criteria A-D constitute a manic episode. At least one lifetime manic episode is required for the diagnosis of bipolar I disorder

Criteria for Mania (≥ 3)

GST PAID

Grandiosity
Sleep (decreased need)
Talkative
Pleasurable activities, Painful consequences
Activity
Ideas (flight of)
Distractible

Hypomanic Episode

- criterion A and B of a manic episode is met, but duration is ≥ 4 d
- episode associated with an uncharacteristic change in functioning that is observable by others but not severe enough to cause marked impairment in social or occupational functioning or to necessitate hospitalization
- absence of psychotic features. (If these are present the episode is, by definition, manic)

Mixed Features

- an episode specifier in bipolar or depression that indicates the presence of both depressive and manic symptoms concurrently, classified by the disorder and primary mood episode component (e.g. bipolar disorder, current episode manic, with mixed features)
- clinical importance due to increased suicide risk
- if found in patient diagnosed with major depression, high index of suspicion for bipolar disorder
- while meeting the full criteria for a major depressive episode, the patient has on most days ≥ 3 of criteria B for a manic episode
- while meeting the full criteria for a manic/hypomanic episode, the patient has on most days ≥ 3 of criteria A for a depressive episode. (The following criterion A cannot count: psychomotor agitation, insomnia, difficulties concentrating, weight changes)

Depressive Disorders

MAJOR DEPRESSIVE DISORDER

DSM-5 Diagnostic Criteria for Major Depressive Disorder (MDD)

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, 5th ed. 2013. American Psychiatric Association

- A. presence of a MDE
- B. the MDE is not better accounted for by schizoaffective disorder and is not superimposed on schizophrenia, schizophreniform disorder, delusional disorder, or psychotic disorder NOS
- C. there has never been a manic episode or a hypomanic episode
- **Note:** This exclusion does not apply if all of the manic-like, or hypomanic-like episodes are substance or treatment-induced or are due to the direct physiological effects of another medical condition
- **specifiers:** with anxious distress, mixed features, melancholic features, atypical features, mood-congruent psychotic features, mood-incongruent psychotic features, catatonia, peripartum onset, seasonal pattern

- single vs. recurrent is an episode descriptor that carries prognostic significance. Recurrent is classified as the patient having two or more distinct MDE episodes; to be considered separate the patient must have gone 2 consecutive months without meeting criteria

Epidemiology

- lifetime prevalence: 12%
- peak prevalence age 15-25 yr (M:F = 1:2)

Etiology

- biological
 - genetic: 65-75% MZ twins; 14-19% DZ twins, 2-4 fold increased risk in first-degree relatives
 - neurotransmitter dysfunction: decreased activity of 5-HT, NE, and DA at the level of the synapse; changes in GABA and glutamate; various changes in brain circuitry and functional connectivity detectable by fMRI
 - neuroendocrine dysfunction: excessive HPA axis activity
 - neuroanatomy: decreased hippocampal volume, increased ventricle sizes
 - neurophysiologic: decreased REM latency and slow-wave sleep; increased REM length
 - immunologic: increased pro-inflammatory cytokines IL-6 and TNF
 - secondary to medical condition, medication, substance use disorder
- psychosocial
 - psychodynamic (e.g. low self-esteem, unconscious aggression towards self or loved ones, disordered attachment)
 - cognitive (e.g. distorted schemata, Beck's cognitive triad: negative views of the self, the world, and the future)
 - environmental factors (e.g. job loss, bereavement, history of abuse or neglect, early life adversity)
 - comorbid psychiatric diagnoses (e.g. anxiety, substance abuse, developmental disability, dementia, eating disorder)

Risk Factors

- sex: F>M, 2:1
- family history: depression, alcohol abuse, suicide attempt or completion
- childhood experiences: loss of parent before age 11, negative home environment (abuse, neglect)
- personality: neuroticism, insecure, dependent, obsessional
- recent stressors: illness, financial, legal, relational, academic
- lack of intimate, confiding relationships or social isolation
- low socioeconomic status

Depression in the Elderly

- affects about 15% of community residents >65 yr old; up to 50% in nursing homes
- high suicide risk due to social isolation, chronic medical illness, decreased independence
- suicide peak: males aged 80-90; females aged 50-65
- dysphoria may not be a reliable indicator of depression in those >85 yr
- often present with somatic complaints (e.g. changes in weight, sleep, energy) or anxiety symptoms
- may have prominent cognitive changes after onset of mood symptoms (dementia syndrome of depression)
- see Table 3, PS22, for a comparison of delirium and dementia

Treatment

- lifestyle: increased aerobic exercise, mindfulness-based stress reduction, zinc supplementation
- biological: SSRIs, SNRIs, other antidepressants, somatic therapies (see *Pharmacotherapy*, PS44, and *Somatic Therapies*, PS52)
 - 1st line pharmacotherapy: sertraline, escitalopram, venlafaxine, mirtazapine
 - for partial or non-response can change class or add augmenting agent: bupropion, quetiapine-XR, aripiprazole, lithium
 - typical response to antidepressant treatment: physical symptoms improve at 2 wk, mood/cognition by 4 wk, if no improvement after 4 wk at a therapeutic dosage alter regimen
 - ECT: currently fastest and most effective treatment for MDD. Consider in severe, psychotic or treatment-resistant cases
 - rTMS: early data support efficacy equivalent to ECT with good safety and tolerability
 - phototherapy: especially if seasonal component, shift work, sleep dysregulation
- psychological
 - individual therapy (psychodynamic, interpersonal, CBT), family therapy, group therapy
- social: vocational rehabilitation, social skills training
- experimental: magnetic seizure therapy, deep brain stimulation, vagal nerve stimulation, ketamine

Prognosis

- one year after diagnosis of MDD without treatment: 40% of individuals still have symptoms that are sufficiently severe to meet criteria for MDD, 20% continue to have some symptoms that no longer meet criteria for MDD, 40% have no mood disorder

Antidepressants for Depression in Medical Illness

Cochrane DB Syst Rev 2010; Issue 3

This systematic review and meta-analysis of 51 RCTs (3,603 patients) compared antidepressants to placebo in patients with a physical disorder (e.g. cancer, MI) who have been diagnosed as depressed (including major depression, adjustment disorder, and dysthymia).

Conclusions: Antidepressants, including SSRIs and TCAs, cause a significant improvement in patients with a physical illness, as compared to placebo.

St. John's Wort for Major Depression

Cochrane DB Syst Rev 2008;4:CD000448

Study: Systematic review of trials that were (1) randomized, double-blinded (2) with patients with major depression (3) comparing St. John's wort (hypericum extracts) with placebo or standard antidepressants and (4) included clinical outcomes.

Patients: 5,489 patients with major depression.

Outcomes: 1. Effectiveness: treatment response measured by a depression scale 2. Safety: the proportion of patients who dropped out due to adverse effects.

Intervention: St. John's wort vs. placebo; St. John's wort vs. standard antidepressants.

Results: 29 trials, 5,489 patients, with 18 comparisons with placebo and 17 with antidepressants. St. John's wort is more effective than placebo (response rate ratio = 1.87), and similarly effective as antidepressants (RRR = 1.02). Less adverse effects with hypericum extracts. However, the effect size is dependent on the country of origin.

PERSISTENT DEPRESSIVE DISORDER

DSM-5 Diagnostic Criteria for Persistent Depressive Disorder

Note: in DSM-IV-TR this was referred to as Dysthymia

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, 5th ed. 2013. American Psychiatric Association

- A. depressed mood for most of the day, for more days than not, as indicated either by subjective account or observation by others, for ≥ 2 yr
Note: In children and adolescents, mood can be irritable and duration must be at least 1 yr
- B. presence, while depressed, of ≥ 2 of the following
 - poor appetite or overeating
 - insomnia or hypersomnia
 - low energy or fatigue
 - low self-esteem
 - poor concentration or difficulty making decisions
 - feelings of hopelessness
- C. during the 2 yr period (1 yr for children or adolescents) of the disturbance, the person has never been without the symptoms in criteria A and B for more than 2 mo at a time
- D. criteria for a major depressive disorder may be continuously present for 2 yr
- E. there has never been a manic episode or a hypomanic episode, and criteria have never been met for cyclothymic disorder
- F. the disturbance is not better explained by a persistent schizoaffective disorder, schizophrenia, delusional disorder, or other specified or unspecified schizophrenia spectrum and other psychotic disorder.
- G. the symptoms are not due to the direct physiological effects of a substance or another medical condition
- H. the symptoms cause clinically significant distress or impairment in social, occupational, or other important areas of functioning

Epidemiology

- lifetime prevalence: 2-3%; M=F

Treatment

- psychological
 - traditionally psychotherapy was the principal treatment for dysthymia; recent evidence suggests some benefit but generally inferior to pharmacological treatment. Combinations of the two may be most efficacious
- biological
 - antidepressant therapy: SSRIs (e.g. sertraline, paroxetine) TCAs (e.g. imipramine) as an outpatient

Cognitive Therapy vs. Medications in the Treatment of Moderate to Severe Depression

Arch Gen Psychiatry 2005;62:409-416

Study: Randomized control trial.

Patients: 240 outpatients with moderate to severe MDD, aged 18-70.

Intervention: 16 wk of paroxetine with or without augmentation with lithium carbonate or desipramine hydrochloride (n=120) versus cognitive behavioural therapy (n=60). Response up to 8 wk was controlled by pill placebo (n=60).

Main Outcomes: The Hamilton Depression Rating scale was used to determine response to treatment.

Results: At 8 wk, 50% (95%CI 41-59%) of patients on medication and 43% (95%CI 31-56%) of patients on CBT had responded in comparison to 25% (95%CI 16-38%) of patients on pill placebo. There was no significant difference between medication and CBT. At 16 wk, 46% of patients on medication and 40% of patients on CBT achieved remission.

Summary: There is no difference in efficacy between CBT vs. paroxetine in the treatment of moderate to severe depression.

Postpartum Mood Disorders

Postpartum "Blues"

- transient period of mild depression, mood instability, anxiety, decreased concentration; considered to be normal changes in response to fluctuating hormonal levels, the stress of childbirth, and the increased responsibilities of motherhood
- occurs in 50-80% of mothers; begins 2-4 d postpartum, usually lasts 48 h, can last up to 10 d
- does not require psychotropic medication
- usually mild or absent: feelings of inadequacy, anhedonia, thoughts of harming baby, suicidal thoughts

MAJOR DEPRESSIVE DISORDER WITH PERIPARTUM ONSET (POSTPARTUM DEPRESSION)

Diagnosis

- MDD that occurs during pregnancy or in the 4 wk following delivery

Clinical Presentation

- typically lasts 2-6 mo; residual symptoms can last up to 1 yr
- may present with psychosis; rare (0.2%), usually associated with mania, but also with MDE
- severe symptoms include extreme disinterest in baby, suicidal and infanticidal ideation

Epidemiology

- occurs in 10% of mothers, risk of recurrence 50%

Risk Factors

- previous history of a mood disorder (postpartum or otherwise), family history of mood disorder
- psychosocial factors: stressful life events, unemployment, marital conflict, lack of social support, unwanted pregnancy, colicky or sick infant

Selective Serotonin Reuptake Inhibitors in Pregnancy and Infant Outcomes

Paediatr Child Health 2011;16:562-563

Study: Canadian Paediatric Society (CPS) Clinical practice guidelines.

Recommendations: It is important to treat depression in pregnancy. There is no evidence that SSRIs increase the risk of major malformations.

There is conflicting evidence concerning the association of paroxetine and cardiac malformations. SSRIs are not contraindicated while breast-feeding.

Treatment

- psychotherapy (CBT or IPT)
- short-term safety of maternal SSRIs for breastfeeding infants established; long-term effects unknown
- if depression severe or psychotic symptoms present, consider ECT

Prognosis

- impact on child development: increased risk of cognitive delay, insecure attachment, behavioural disorders
- treatment of mother improves outcome for child at 8 mo through increased mother-child interaction

Bipolar Disorders

BIPOLAR I / BIPOLAR II DISORDER

Definition

- Bipolar I Disorder
 - disorder in which at least one manic episode has occurred
 - if manic symptoms lead to hospitalization, or if there are psychotic symptoms, the diagnosis is BP I
 - commonly accompanied by at least 1 MDE but not required for diagnosis
 - time spent in mood episodes: 53% asymptomatic, 32% depressed, 9% cycling/mixed, 6% hypo/manic
- Bipolar II Disorder
 - disorder in which there is at least 1 MDE, 1 hypomanic and no manic episodes
 - while hypomania is less severe than mania, Bipolar II is not a “milder” form of Bipolar I
 - time spent in mood episodes: 46% asymptomatic, 50% depressed, 1% cycling/mixed, 2% hypo/manic
 - a great masquerader, Bipolar II is often missed due to the severity and chronicity of depressive episodes and low rates of spontaneous reporting and recognition of hypomanic episodes

Classification

- classification of bipolar disorder involves describing the disorder (I or II) and the current or most recent mood episode as either manic, hypomanic, or depressed
- specifiers: with anxious distress, depressed with mixed features, hypo/manic with mixed features, melancholic features, atypical features, mood-congruent or -incongruent psychotic features, catatonia, peripartum onset, seasonal pattern, rapid cycling (4+ mood episodes in a 1 yr)

Epidemiology

- lifetime prevalence: 1% BPI, 1.1% BP II, 2.4% Subthreshold BPD; M:F = 1:1
- age of onset: teens to 20s, usually MDE first, manic episode 6-10 years after, average age of first manic episode 32 yr

Risk Factors

- genetic: 60-65% of bipolar patients have family history of major mood disorders, especially bipolar disorders
- clinical features predictive of bipolar > unipolar diagnosis given history of MDE: early age of onset (<25 yr), increased number of MDEs, psychotic symptoms, postpartum onset, anxiety disorders (especially separation, panic), antidepressant failure due to early “poop out” or hypomanic symptoms, early impulsivity and aggression, substance abuse, cyclothymic temperament

Treatment

- **lifestyle:** psychoeducation for patient and supports on cycling nature of illness, ensure regular check ins, develop early warning system, “emergency plan” for manic episodes, promote stable routine (sleep, meals, exercise)
- **biological:** lithium, anticonvulsants, antipsychotics, ECT (if refractory); monotherapy with antidepressants should be avoided
 - mood stabilizers vary in their ability to “treat” (reduce symptoms acutely) or “stabilize” (prevent relapse and recurrence) manic and depressive symptoms; multi-agent therapy is common
 - treating mania: lithium, valproate, carbamazepine (2nd line), SGA, ECT, benzodiazepines (for acute agitation)
 - preventing mania: same as above but usually at lower dosages, minus benzodiazepines
 - treating depression: lithium, lurasidone, quetiapine, lamotrigine, antidepressants (only with mood stabilizer), ECT
 - preventing depression: same as above plus aripiprazole, valproate (note: quetiapine first line in treating bipolar II depression)
 - mixed episode or rapid cycling: multi-agent therapy, lithium or valproate + SGA (lurasidone, aripiprazole, olanzapine)

Bipolar II is quite often missed and many patients are symptomatic for up to a decade before accurate diagnosis and treatment

Patients with bipolar disorder are at higher risk for suicide when they switch from mania to depression, especially as they become aware of consequences of their behaviour during the manic episode

Lithium is among few agents with proven efficacy in preventing suicide attempts and completions and international research has found that populations with higher lithium levels in their drinking water have lower suicide rates in their general population

The 4 L's for Bipolar Depression
Lithium, Lamotrigine, Lurasidone, Seroquel

- **psychological:** supportive or psychodynamic psychotherapy, CBT, IPT or interpersonal social rhythm therapy, family therapy
- **social:** vocational rehabilitation, consider leave of absence from school/work, assess capacity to manage finances, drug and EtOH cessation, sleep hygiene, social skills training, education and recruitment of family members

Course and Prognosis

- high suicide rate (15% mortality from suicide), especially in mixed states
- BP I and II are chronic conditions with a relapsing and remitting course featuring alternating manic and depressive episodes; depressive symptoms tend to occur more frequently and last longer than manic episodes
- can achieve high level of functioning between episodes
- may switch rapidly between depression and mania without any period of euthymia in between
- high recurrence rate for mania – 90% will have a subsequent episode in the next 5 yr
- long term follow up of BP I – 15% well, 45% well with relapses, 30% partial remission, 10% chronically ill

CYCLOTHYMIA

Diagnosis

- presence of numerous periods of hypomanic and depressive symptoms (not meeting criteria for full hypomanic episode or MDE) for ≥ 2 yr; never without symptoms for >2 mo
- never have met criteria for MDE, manic or hypomanic episodes
- symptoms are not due to the direct physiological effects of a substance or GMC
- symptoms cause clinically significant distress or impairment in social, occupational, or other important areas of functioning

Treatment

- similar to Bipolar I: mood stabilizer \pm psychotherapy, avoid antidepressant monotherapy, treat any comorbid substance use disorder

A Randomized Controlled Trial of Cognitive Therapy for Bipolar Disorder: Focus on Long-Term Change

J Clin Psychiatry 2006;67:277-286

Study: Randomized, blinded clinical trial.

Patients: 52 patients with DSM-IV bipolar 1 or 2 disorder.

Intervention: Patients allocated to either a 6 mo trial of cognitive therapy (CT) with emotive techniques or treatment as usual. Both groups received mood stabilizers.

Main Outcomes: Relapse rates, dysfunctional attitudes, psychosocial functioning, hopelessness, self-control, medication adherence. Patients were assessed by independent raters blinded to treatment group.

Results: At 6 mo, CT patients experienced fewer depressive symptoms and fewer dysfunctional attitudes. There was a non-significant ($p=0.06$) trend to greater time to depressive relapse. At 12 mo follow-up, CT patients had lower Young Mania Rating scores and improved behavioural self-control. At 18 mo, CT patients reported less severity of illness.

Conclusions: CT appears to provide benefits in the 12 mo after completion of therapy.

Anxiety Disorders

Definition

- anxiety is a universal human characteristic involving tension, apprehension, or even terror
- serves as an adaptive mechanism to warn about an external threat by activating the sympathetic nervous system (fight or flight)
- manifestations of anxiety can be described through
 - physiology: main brain structure involved is the amygdala (fear conditioning); neurotransmitters involved include 5-HT, cholecystokinin, epinephrine, norepinephrine, DA
 - psychology: one's perception of a given situation is distorted which causes one to believe it is threatening in some way
 - behaviour: once feeling threatened, one responds by escaping or facing the situation, thereby causing a disruption in daily functioning
- anxiety becomes pathological when:
 - fear is greatly out of proportion to risk/severity of threat
 - response continues beyond existence of threat or becomes generalized to other similar or dissimilar situations
 - social or occupational functioning is impaired
 - often comorbid with substance use and depression

Differential Diagnosis

Table 2. Differential Diagnosis of Anxiety Disorders

Cardiovascular	Post-MI, arrhythmia, congestive heart failure, pulmonary embolus, mitral valve prolapse
Respiratory	Asthma, COPD, pneumonia, hyperventilation
Endocrine	Hyperthyroidism, pheochromocytoma, hypoglycemia, hyperadrenalism, hyperparathyroidism
Metabolic	Vitamin B ₁₂ deficiency, porphyria
Neurologic	Neoplasm, vestibular dysfunction, encephalitis
Substance-Induced	Intoxication (caffeine, amphetamines, cocaine, thyroid preparations, OTC for colds/decongestants), withdrawal (benzodiazepines, alcohol)
Other Psychiatric Disorders	Psychotic disorders, mood disorders, personality disorders (OCPD), somatoform disorders

Medical Workup of Anxiety Disorder

- routine screening: physical exam, CBC, thyroid function test, electrolytes, urinalysis, urine drug screening
- additional screening: neurological consultation, chest X-ray, ECG, CT head

Panic Disorder

DSM-5 Diagnostic Criteria for Panic Disorder

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, 5th ed. 2013. American Psychiatric Association

- A. recurrent unexpected panic attacks - a panic attack is an abrupt surge of intense fear or intense discomfort that reaches a peak within minutes, and during which time four (or more) of the following symptoms occur
 - palpitations, pounding heart, or accelerated heart rate
 - sweating
 - trembling or shaking
 - sensations of shortness of breath or smothering
 - feelings of choking
 - chest pain or discomfort
 - nausea or abdominal distress
 - feeling dizzy, unsteady, light-headed, or faint
 - chills or heat sensations
 - paresthesias (numbness or tingling sensations)
 - derealization (feelings of unreality) or depersonalization (being detached from oneself)
 - fear of losing control or "going crazy"
 - fear of dying
- B. 1 mo (or more) of "anxiety about panic attacks" - at least one of the attacks has been followed by one or both of the following:
 - persistent concern or worry about additional panic attacks or their consequences
 - a significant maladaptive change in behaviour related to the attacks
- C. the disturbance is not attributable to the physiological effects of a substance or another medical condition
- D. the disturbance is not better explained by another mental disorder

Epidemiology

- prevalence: 2-5% (one of the top five most common reasons to see a family doctor); M:F = 1:2-3
- onset: average early-mid 20s, familial pattern

Treatment

- psychological
 - CBT: interoceptive exposure (eliciting symptoms of a panic attack and learning to tolerate the symptoms without coping strategies); cognitive restructuring (addressing underlying beliefs regarding the panic attacks), relaxation techniques (visualization, box-breathing)
- pharmacological
 - SSRIs: fluoxetine, citalopram, paroxetine, fluvoxamine, sertraline
 - SNRI: venlafaxine
 - with SSRI/SNRI start with low doses, titrate up slowly
 - anxiety disorders often require treatment at higher doses for a longer period of time than depression (i.e. full response may take up to 12 wk)
 - treat for up to 1 year after symptoms resolve to avoid relapse
 - to prevent non-compliance due to physical side effects, explain symptoms to expect prior to initiation of therapy
 - other antidepressants (mirtazapine, MAOIs)
 - ♦ consider avoiding bupropion or TCAs due to stimulating effects (exacerbate anxious symptoms)
 - benzodiazepines (short-term, low dose, regular schedule, long half-life, avoid prn usage)

Prognosis

- 6-10 yr post-treatment: 30% well, 40-50% improved, 20-30% no change or worse
- clinical course: chronic, but episodic with psychosocial stressors

Figure 2. Panic attack

Criteria for Panic Disorder (≥4)

STUDENTS FEAR the 3 Cs

- Sweating
- Trembling
- Unsteadiness, dizziness
- Depersonalization, Derealization
- Excessive heart rate, palpitations
- Nausea
- Tingling
- Shortness of breath
- Fear of dying, losing control, going crazy
- 3 Cs: Chest pain, Chills, Choking

Panic Attack vs. Panic Disorder

Panic disorder consists of panic attacks + other criteria

Panic attack is not a codable disorder and can occur in the context of many different disorders

Starting Medication for Anxiety

Start low, go slow, aim high and explain symptoms to expect prior to initiation of therapy

Agoraphobia

DSM-5 Diagnostic Criteria for Agoraphobia

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, 5th ed. 2013. American Psychiatric Association

- "Anxiety about not being able to escape, > 6 mo"
- A. marked fear or anxiety about two (or more) of the following five situations:
 - using public transportation
 - being in open spaces
 - being in enclosed places
 - standing in line or being in a crowd
 - being outside of the home alone
- B. the individual fears or avoids these situations because of thoughts that escape might be difficult or help might not be available in the event of developing panic-like symptoms or other incapacitating or embarrassing symptoms

- C. the agoraphobic situations almost always provoke fear or anxiety
 - D. the agoraphobic situations are actively avoided, require the presence of a companion, or are endured with intense fear or anxiety
 - E. the fear or anxiety is out of proportion to the actual danger posed by the agoraphobic situations and to the sociocultural context
 - F. the fear, anxiety, or avoidance is persistent, typically lasting ≥ 6 mo
 - G. the fear, anxiety, or avoidance causes clinically significant distress or impairment in social, occupational, or other important areas of functioning
 - H. if another medical condition is present, the fear, anxiety, or avoidance is clearly excessive
 - I. the fear, anxiety, or avoidance is not better explained by the symptoms of another mental disorder and are not related exclusively to obsessions, perceived defects or flaws in physical appearance, reminders of traumatic events, or fear of separation
- Note:** agoraphobia is diagnosed irrespective of the presence of panic disorder. If an individual's presentation meets criteria for panic disorder and agoraphobia, both diagnoses should be assigned

Treatment

- as per panic disorder

Generalized Anxiety Disorder

DSM-5 Diagnostic Criteria for Generalized Anxiety Disorder

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, 5th ed. 2013. American Psychiatric Association

- A. excessive anxiety and worry (apprehensive expectation), occurring more days than not for at least 6 mo, about a number of events or activities (such as work or school performance)
- B. the individual finds it difficult to control the worry
- C. the anxiety and worry are associated with three (or more) of the following six symptoms (with at least some symptoms having been present for more days than not for the past 6 mo)
 - 1. restlessness or feeling keyed up or on edge
 - 2. being easily fatigued
 - 3. difficulty concentrating or mind going blank
 - 4. irritability
 - 5. muscle tension
 - 6. sleep disturbance (difficulty falling or staying asleep, or restless, unsatisfying sleep)
- D. the anxiety, worry, or physical symptoms cause clinically significant distress or impairment in social, occupational, or other important areas of functioning
- E. the disturbance is not attributable to the physiological effects of a substance or another medical condition
- F. the disturbance is not better explained by another mental disorder

Criteria for GAD (≥ 3)

C-FIRST

Concentration issues
Fatigue
Irritability
Restlessness
Sleep disturbance
Tension (muscle)

Epidemiology

- 1 yr prevalence: 3-8%; M:F = 1:2
 - if considering only those receiving inpatient treatment, ratio is 1:1
- most commonly presents in early adulthood

Treatment

- lifestyle: caffeine and EtOH avoidance, sleep hygiene
- psychological: CBT including relaxation techniques, mindfulness
- biological
 - SSRIs and SNRIs are 1st line (paroxetine, escitalopram, sertraline, venlafaxine XL)
 - 2nd line: buspirone (tid dosing), bupropion (caution due to stimulating effects),
 - add-on benzodiazepines (short-term, low dose, regular schedule, long half-life, avoid prn usage)
 - β -blockers not recommended

Prognosis

- chronically anxious adults become less so with age
- depends on pre-morbid personality functioning, stability of relationships, work, and severity of environmental stress
- difficult to treat

Phobic Disorders

Specific Phobia

- definition: marked and persistent (> 6 mo) fear that is excessive or unreasonable, cued by presence or anticipation of a specific object or situation
- lifetime prevalence 12-16%; M:F ratio variable
- types: animal/insect, environment (heights, storms), blood/injection/injury, situational (airplane, closed spaces), other (loud noise, clowns)

Social Phobia (Social Anxiety Disorder)

- definition: marked and persistent (> 6 mo) fear of social or performance situations in which one is exposed to unfamiliar people or to possible scrutiny by others; fearing he/she will act in a way that may be humiliating or embarrassing (e.g. public speaking, initiating or maintaining conversation, dating, eating in public)
- 12 month prevalence rate may be as high as 7%; M:F ratio approximately equal

Diagnostic Criteria for Phobic Disorders

- exposure to stimulus almost invariably provokes an immediate anxiety response; may present as a panic attack
- person recognizes fear as excessive or unreasonable
- situations are avoided or endured with anxiety/distress
- significant interference with daily routine, occupational/social functioning, and/or marked distress

Treatment

- psychological
 - cognitive behaviour therapy (focusing on both in vivo and virtual exposure therapy, gradually facing feared situations)
 - behavioural therapy is more efficacious than medication
- biological
 - SSRIs/SNRIs (e.g. fluoxetine, paroxetine, sertraline, venlafaxine), MAOIs
 - β -blockers or benzodiazepines in acute situations (e.g. public speaking)

Prognosis

- chronic

Obsessive-Compulsive Disorder

DSM-5 Diagnostic Criteria for Obsessive-Compulsive Disorder

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, 5th ed. 2013. American Psychiatric Association

- A. presence of obsessions, compulsions, or both
- obsessions are defined by (1) and (2)
 1. recurrent and persistent thoughts, urges, or images that are experienced, at some time during the disturbance, as intrusive and unwanted, and cause marked anxiety or distress in most individuals
 2. the individual attempts to ignore or suppress such thoughts, urges, or images, or to neutralize them with some other thought or action (i.e. by performing a compulsion; see below)
 - compulsions are defined by (1) and (2)
 1. repetitive behaviours (e.g. hand washing, ordering, checking) or mental acts (e.g. praying, counting, repeating words silently) that the individual feels driven to perform in response to an obsession or according to rules that must be applied rigidly
 2. behaviours mental acts are aimed at preventing or reducing anxiety or distress, or preventing some dreaded event or situation; however, these behaviours or mental acts are not connected in a realistic way with what they are designed to neutralize or prevent, or are clearly excessive
- B. the obsessions or compulsions are time-consuming (e.g. take >1 h/d) or cause clinically significant distress or impairment in social, occupational, or other important areas of functioning
- C. the obsessive-compulsive symptoms are not attributable to the physiological effects
- D. the disturbance is not better explained by the symptoms of another mental disorder

Epidemiology

- 12 mo prevalence 1.1-1.8%; females affected at slightly higher rates than males
- rate of OCD in first-degree relatives is higher than in the general population

Treatment

- CBT: exposure with response prevention (ERP) – involves exposure to feared situations with the addition of preventing the compulsive behaviours; cognitive strategies include challenging underlying beliefs
- pharmacotherapy: SSRIs/SNRIs (12-16 week trials, higher doses vs. depression), clomipramine; adjunctive antipsychotics (risperidone)

Prognosis

- tends to be refractory and chronic

Trauma- and Stressor-Related Disorders

Post-Traumatic Stress Disorder

DSM-5 Diagnostic Criteria for Post-Traumatic Stress Disorder

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, 5th ed. 2013. American Psychiatric Association.

- A. exposure to actual or threatened death, serious injury, or sexual violence in one (or more) of the following ways
1. directly experiencing the traumatic event(s)
 2. witnessing, in person, the event(s) as it occurred to others
 3. learning that the traumatic event(s) occurred to a close family member or close friend. In cases of actual or threatened death of a family member or friend, the event(s) must have been violent or accidental
 4. experiencing repeated or extreme exposure to aversive details of the traumatic event(s) (e.g. first responders collecting human remains; police officers repeatedly exposed to details of child abuse)
- B. presence of one (or more) of the following intrusion symptoms associated with the traumatic event(s), beginning after the traumatic event(s) occurred
1. recurrent, involuntary, and intrusive distressing memories of the traumatic event(s)
 2. recurrent distressing dreams in which the content and/or affect of the dream are related to the traumatic event(s)
 3. dissociative reactions (e.g. flashbacks) in which the individual feels or acts as if the traumatic event(s) were recurring
 4. intense or prolonged psychological distress at exposure to internal or external cues that symbolize or resemble an aspect of the traumatic event(s)
 5. marked physiological reactions to internal or external cues that symbolize or resemble an aspect of the traumatic event(s)
- C. persistent avoidance of stimuli associated with the traumatic event(s), beginning after the traumatic event(s) occurred, as evidenced by one or both of the following
1. avoidance of or efforts to avoid distressing memories, thoughts, or feelings about or closely associated with the traumatic event(s)
 2. avoidance of or efforts to avoid external reminders (people, places, conversations, activities, objects, situations) that arouse distressing memories, thoughts, or feelings about or closely associated with the traumatic event(s)
- D. negative alterations in cognitions and mood associated with the traumatic event(s), beginning or worsening after the traumatic event(s) occurred, as evidenced by two (or more) of the following
1. inability to remember an important aspect of the traumatic event(s)
 2. persistent and exaggerated negative beliefs or expectations about oneself, others, or the world
 3. persistent, distorted cognitions about the cause or consequences of the traumatic event(s) that lead the individual to blame himself/herself or others
 4. persistent negative emotional state (e.g. fear, horror, anger, guilt, or shame)
 5. markedly diminished interest or participation in significant activities
 6. feelings of detachment or estrangement from others
 7. persistent inability to experience positive emotions
- E. marked alterations in arousal and reactivity associated with the traumatic event(s), beginning or worsening after the traumatic event(s) occurred, as evidenced by two (or more) of the following
1. irritable behaviour and angry outbursts (with little or no provocation) typically expressed as verbal or physical aggression toward people or objects
 2. reckless or self-destructive behaviour
 3. hypervigilance
 4. exaggerated startle response
 5. problems with concentration
 6. sleep disturbance (e.g. difficulty falling or staying asleep or restless sleep)
- F. duration of the disturbance (criteria B, C, D, and E) is more than 1 mo
- G. the disturbance causes clinically significant distress or impairment in social, occupational, or other important areas of functioning
- H. the disturbance is not attributable to the physiological effects of a substance or another medical condition

Epidemiology

- prevalence of 7% in general population
- men's trauma is most commonly combat experience/physical assault; women's trauma is usually physical or sexual assault

Treatment

- psychotherapy, CBT
 - ensure safety and stabilize: e.g. emotional regulation techniques (e.g. breathing, relaxation)
 - once coping mechanisms established, can explore/mourn trauma - challenge dysfunctional beliefs, etc.
 - reconnect and integrate - exposure therapy, etc.

Criteria for Post-Traumatic Stress Disorder

TRAUMA

Traumatic event

Re-experience the event

Avoidance of stimuli associated with the trauma

Unable to function

More than a Month

Arousal increased

+ negative alterations in cognition and mood

Acute Stress Disorder

- May be a precursor to PTSD
- Similar symptoms to PTSD
- Symptoms persist 3 d after a trauma until 1 mo after the exposure

- biological
 - SSRIs (e.g. paroxetine, sertraline)
 - prazosin (for treating disturbing dreams and nightmares)
 - benzodiazepines (for acute anxiety)
 - adjunctive atypical antipsychotics (risperidone, olanzapine)
- eye movement desensitization and reprocessing (EMDR): an experimental method of reprocessing memories of distressing events by recounting them while using a form of dual attention stimulation such as eye movements, bilateral sound, or bilateral tactile stimulation (its use is controversial because of limited evidence)

Complications

- substance abuse, relationship difficulties, depression, impaired social and occupational functioning disorders, personality disorders

Adjustment Disorder

- a versatile clinical entity designed to capture patients who have difficulty coping with a stressful life event or situation and develop acute, often transient, emotional or behavioural symptoms that resemble less severe versions of other psychiatric conditions

DSM-5 Diagnostic Criteria for Adjustment Disorder

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, 5th ed. 2013. American Psychiatric Association

- the development of emotional or behavioural symptoms in response to an identifiable stressor(s) occurring within 3 mo of the onset of the stressor(s)
- these symptoms or behaviours are clinically significant as evidenced by either of the following:
 - marked distress that is in excess of what would be expected from exposure to the stressor
 - significant impairment in social or occupational (academic) functioning
- the stress-related disturbance does not meet criteria for another mental disorder and is not merely an exacerbation of a pre-existing mental disorder
- the symptoms do not represent normal bereavement
- once the stressor (or its consequences) has terminated, the symptoms do not persist for more than an additional 6 mo
 - **specifiers:** with depressed mood, with anxiety, with mixed anxiety/depression, with conduct disturbance, with mixed disturbance of conduct/emotions, unspecified

Classification

- types of stressors
 - single (e.g. termination of romantic relationship)
 - multiple (e.g. marked business difficulties and marital problems)
 - recurrent (e.g. seasonal business crises)
 - continuous (e.g. living in a crime-ridden neighbourhood)
 - developmental events (e.g. going to school, leaving parental home, getting married, becoming a parent, failing to attain occupational goals, retirement)

Epidemiology

- F:M 2:1, prevalence 2-8% of the population

Treatment

- brief psychotherapy: individual or group (particularly useful for patients dealing with unique and specific medical issues; e.g. colostomy or renal dialysis groups), crisis intervention
- biological
 - benzodiazepines may be used for those with significant anxiety symptoms (short-term, low-dose, regular schedule)

Bereavement

Clinical Presentation

- bereavement is a normal psychological and emotional reaction to a significant loss, also called grief or mourning
- length and characteristics of "normal" bereavement are variable between individuals/cultures; however, there are general commonalities in the symptoms, course and expected resolution that allow clinicians to monitor for abnormal severity
- normal response: *protest* → *searching and acute anguish* → *despair and detachment* → *reorganization*
- if a patient meets criteria for MDD, even in the context of a loss or bereavement scenario, they are still diagnosed with MDD
- presence of the following symptoms may indicate abnormal grief/presence of MDD
 - guilt about things other than actions taken or not taken by the survivor at the time of death
 - thoughts of death other than the survivor feeling that they would be better off dead or should have died with the deceased person; morbid preoccupation with worthlessness

Risk Factors for Poor Bereavement Outcome

- Poor social supports
- Unanticipated death or lack of preparation for death
- Highly dependent relationship with deceased
- High initial distress
- Other concurrent stresses and losses
- Death of a child
- Pre-existing psychiatric disorders, especially depression and separation anxiety

- marked psychomotor retardation; prolonged and marked functional impairment
- hallucinatory experiences other than thinking that the survivor hears the voice of or transiently sees the image of the deceased person
- dysphoria that is pervasive and independent of thoughts or triggers of the deceased, absence of mood reactivity
- after 12 mo, if patient continues to yearn/long for the deceased, experience intense sorrow/emotional pain in response to the death, remain preoccupied with the deceased or with their circumstance of death, then may start to consider a diagnosis of “persistent complex bereavement disorder”

Treatment

- support and watchful waiting should be first line, as well as education and normalization of the grief process
- screen for increased alcohol, cigarette and drug use
- normal grief should not be treated with antidepressant or anti-anxiety medication, as it is important to allow the person to experience the whole mourning process to achieve resolution
- psychosocial: for those needing additional support, complex grief/bereavement, or significant MDD, grief therapy (individual or group) is indicated
- pharmacotherapy: MDD present, past history of mood disorders, severe or autonomous symptoms

Bereavement is associated with a significant increase in morbidity and mortality acutely following the loss, with effects seen up to 1 yr after

Loneliness is the most common symptom that continues to persist in normal bereavement and may last several years

Neurocognitive Disorders

Delirium

- see [Neurology](#), N21 and [Geriatric Medicine](#), GM3

DSM-5 Diagnostic Criteria for Delirium

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, 5th ed. 2013. American Psychiatric Association

- attention and awareness: disturbance in attention (i.e. reduced ability to direct, focus, sustain, and shift attention) and awareness (reduced orientation to the environment)
- acute and fluctuating: disturbance develops over short period of time (usually hours to days), represents a change from baseline attention and awareness, and tends to fluctuate in severity during the course of a day
- cognitive changes: an additional disturbance in cognition (e.g. memory deficit, disorientation, language, visuospatial ability, or perception)
- not better explained: disturbances in criteria A and C are not better explained by another neurocognitive disorder (pre-existing, established, or evolving) and do not occur in the context of a severely reduced level of arousal (e.g. coma)
- direct physiological cause: evidence that disturbance is a direct physiological consequence of another medical condition, substance intoxication or withdrawal (i.e. due to a drug of abuse or medication), toxin, or is due to multiple etiologies

- **Note:** can have HYPERactive, HYPOactive, or MIXED presentation

Clinical Presentation and Assessment

- common symptoms
 - distractibility, disorientation (time, place, rarely person)
 - misinterpretations, illusions, hallucinations
 - speech/language disturbances (dysarthria, dysnomia, dysgraphia)
 - affective symptoms (anxiety, fear, depression, irritability, anger, euphoria, apathy)
 - shifts in psychomotor activity (groping/picking at clothes, attempts to get out of bed when unsafe, sudden movements, sluggishness, lethargy)
- Folstein Mini Mental Status Exam is helpful to assess baseline of altered mental state (i.e. score will improve as symptoms resolve)

Risk Factors

- hospitalization (incidence 10-56%)
- previous delirium
- nursing home residents (incidence 60%)
- polypharmacy (e.g. anticholinergic)
- old age (especially males)
- severe illness (e.g. cancer, AIDS)
- recent anesthesia or surgery
- substance abuse
- pre-existing cognitive impairment, brain pathology, psychiatric illness

Etiology

- Infectious (encephalitis, meningitis, UTI, pneumonia)
- Withdrawal (alcohol, barbiturates, benzodiazepines)
- Acute metabolic disorder (electrolyte imbalance, hepatic or renal failure)
- Trauma (head injury, post-operative)

Confusion Assessment Method (CAM) for Diagnosis of Delirium

Highly sensitive and specific method to diagnosis delirium

Part 1: an assessment instrument that screens for overall cognitive impairment.

Part 2: includes four features found best able to distinguish delirium from other cognitive impairments

Need (1) + (2) + (3 or 4)

- (1) Acute onset and fluctuating course
- (2) Inattention
- (3) Disorganized thinking
- (4) Altered level of consciousness - hyperactive or hypoactive

Visual hallucinations are organic until proven otherwise

- CNS pathology (stroke, hemorrhage, tumour, seizure disorder, Parkinson's)
- Hypoxia (anemia, cardiac failure, pulmonary embolus)
- Deficiencies (vitamin B₁₂, folic acid, thiamine)
- Endocrinopathies (thyroid, glucose, parathyroid, adrenal)
- Acute vascular (shock, vasculitis, hypertensive encephalopathy)
- Toxins: substance use, sedatives, opioids (especially morphine), anesthetics, anticholinergics, anticonvulsants, dopaminergic agents, steroids, insulin, glyburide, antibiotics (especially quinolones), NSAIDs
- Heavy metals (arsenic, lead, mercury)

Investigations

- standard: CBC and differential, electrolytes, Ca²⁺, PO₄³⁻, Mg²⁺, glucose, ESR, LFTs, Cr, BUN, TSH, vitamin B₁₂, folate, albumin, urine C&S, R&M
- as indicated: ECG, CXR, CT head, toxicology/heavy metal screen, VDRL, HIV, LP, blood cultures, EEG (typically abnormal - generalized slowing or fast activity, can also be used to rule out underlying seizures or post-ictal states as etiology)
- indications for CT head: focal neurological deficit, acute change in status, anticoagulant use, acute incontinence, gait abnormality, history of cancer

Management

- intrinsic
 - identify and treat underlying cause immediately
 - stop all non-essential medications
 - maintain nutrition, hydration, electrolyte balance and monitor vitals
- extrinsic
 - environment: quiet, well-lit, near window for cues regarding time of day
 - optimize hearing and vision
 - room near nursing station for closer observation; constant care if patient jumping out of bed, pulling out lines
 - family member present for reassurance and re-orientation
 - frequent orientation - calendar, clock, reminders
- biological
 - low dose, high potency antipsychotics: haloperidol has the most evidence; reasonable alternatives include risperidone, olanzapine (more sedating, less QT prolongation), quetiapine (if EPS), aripiprazole
 - benzodiazepines only to be used in alcohol withdrawal delirium; otherwise, can worsen delirium
 - try to minimize anticholinergic side effects
- physical restraints if patient becomes violent

Prognosis

- up to 50% 1 yr mortality rate after episode of delirium

Dosing for Haloperidol in Delirium

Typical dose 0.5-1 mg
Dosing schedule varies with clinical approach: PRN often used, but QHS or QHS and QAM also employed to account for hypoactive delirium, which is otherwise often missed

Major Neurocognitive Disorder (Dementia)

- see [Neurology](#), N22

DSM-5 Diagnostic Criteria for Major Neurocognitive Disorder

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, 5th ed. 2013. American Psychiatric Association

- evidence of significant cognitive decline from a previous level of performance in one or more cognitive domains (complex attention, executive function, learning and memory, language, perceptual-motor, or social cognition) based on
 - concern of the individual, a knowledgeable informant, or the clinician that there has been a significant decline in cognitive function; and
 - substantial impairment in cognitive performance, preferably documented by standardized neuropsychological testing or, in its absence, another quantified clinical assessment
- cognitive deficits interfere with independence in everyday activities (i.e. at a minimum, requiring assistance with complex instrumental activities of daily living such as paying bills or managing medications)
 - **Note:** if do not interfere in B, and impairments are mild-moderate in A, considered "mild neurocognitive disorder"; see [Neurology](#), N21
- cognitive deficits do not occur exclusively in the context of a delirium
- cognitive deficits are not better explained by another mental disorder (e.g. major depressive disorder, schizophrenia)

The 4 As of Dementia

Amnesia
Aphasia
Apraxia
Agnosia

The "Mini Cog" Rapid Assessment

- 3 word recall
- Clock drawn to "10 past 11"
- Animal lists

Specify whether due to

Alzheimer's disease	Traumatic brain injury	Huntington's disease
Frontotemporal lobar degeneration	Substance/medication use	Another medical condition
Lewy body disease	HIV infection	Multiple etiologies
Vascular disease	Prion disease	Unspecified
Normal pressure hydrocephalus	Parkinson's disease	

Epidemiology

- prevalence increases with age: 10% in patients >65 yr of age; 25% in patients >85 yr of age
- prevalence is increased in people with Down's syndrome and head trauma
- Alzheimer's disease comprises >50% of cases; vascular causes comprise approximately 15% of cases (other causes of dementia neurocognitive disorder – see [Neurology](#), N25-N27)
- average duration of illness from onset of symptoms to death is 8-10 yr

Subtypes

- with or without behavioural disturbance (e.g. wandering, agitation)
- early-onset: age of onset <65 yr
- late-onset: age of onset >65 yr

Investigations (rule out reversible causes)

- standard: see [Delirium](#), PS20
- as indicated: VDRL, HIV, SPECT, CT head in dementia
- indications for CT head: same as for delirium, plus: age <60, rapid onset (unexplained decline in cognition or function over 1-2 mo), dementia of relatively short duration (<2 yr), recent significant head trauma, unexplained neurological symptoms (new onset of severe headache/seizures)

Management

- see [Neurology](#), N22 for further management
- treat underlying medical problems and prevent others
- provide orientation cues for patient (e.g. clock, calendar)
- provide education and support for patient and family (e.g. day programs, respite care, support groups, home care)
- consider long-term care plan (nursing home) and power of attorney/living will
- inform Ministry of Transportation about patient's inability to drive safely
- consider pharmacological therapy
 - cholinesterase inhibitors (e.g. donepezil [Aricept®], rivastigmine, galantamine) for mild to severe disease
 - NMDA receptor antagonist (e.g. memantine) for moderate to severe disease
 - low-dose neuroleptics (e.g. risperidone, quetiapine), antidepressants or trazodone if behavioural or emotional symptoms prominent – start low and go slow
 - reassess pharmacological therapy every 3 mo

Flags for Differentiating Most Common Causes of Dementia

Alzheimer's disease: predominantly memory and learning issues

Frontotemporal degeneration: language type (early preservation), behavioural type (apathy/disinhibition/self-neglect)

Lewy body disease: recurrent, soft visual hallucinations (e.g. rabbits), autonomic impairment (falls, hypotension), EPS, does not respond well to pharmacotherapy, fluctuating degree of cognitive impairment

Vascular disease: vascular risk factors, focal neurological signs, abrupt onset, stepwise progression

Normal pressure hydrocephalus: abnormal gait, early incontinence, rapidly progressive

Table 3. Comparison of Dementia, Delirium, and Pseudodementia of Depression

	Dementia/Major Neurocognitive Disorder	Delirium	Pseudodementia of Depression
Onset	Gradual/step-wise decline	Acute (h-d)	Subacute
Duration	Months-years	Days-weeks	Variable
Natural History	Progressive Usually irreversible	Fluctuating, reversible High morbidity/mortality in very old	Recurrent Usually reversible
Level of Consciousness	Normal	Fluctuating (over 24 h)	Normal
Attention	Not initially affected	Decreased (wandering, easy distraction)	Difficulty concentrating
Orientation	Intact initially	Impaired (usually to time and place), fluctuates	Intact
Behaviour	Disinhibition, impairment in ADL/IADL, personality change, loss of social graces	Severe agitation/retardation	Importuning, self-harm/suicide
Psychomotor	Normal	Fluctuates between extremes	Slowing
Sleep Wake Cycle	Fragmented sleep at night	Reversed sleep wake cycle	Early morning awakening
Mood and Affect	Labile but not usually anxious	Anxious, irritable, fluctuating	Depressed, stable
Cognition	Decreased executive functioning, paucity of thought	Fluctuating preceded by mood changes	Fluctuating
Memory Loss	Recent, eventually remote	Marked recent	Recent
Language	Agnosia, aphasia, decreased comprehension, repetition, speech (echolalia, palilalia)	Dysnomia, dysgraphia, speech rambling, irrelevant, incoherent, subject changes	Not affected
Delusions	Compensatory	Nightmarish and poorly formed	Nihilistic, somatic
Hallucinations	Variable	Visual common	Less common, auditory predominates
Quality of Hallucinations	Vacuous/bland	Frightening/bizarre	Self-deprecatory
Medical Status	Variable	Acute illness, drug toxicity	Rule out systemic illness, medications

Substance-Related and Addictive Disorders

- a neurobiological disorder involving compulsive drug seeking and drug taking, despite adverse consequences, with loss of control over drug use (think issues with the “3 Cs”: compulsive, consequences, control)

Overview

- dependence is the hallmark of substance use disorders and comes in the following forms:
 - behavioural: substance-seeking activities and pathological use patterns
 - physical: physiologic withdrawal effects without use
 - psychological: continuous or intermittent cravings for the substance to avoid dysphoria or attain drug state
- abuse: drug use that deviates from the approved social or medical pattern, usually causing impairment or disruption to function in self or others
- these disorders are usually chronic with a relapsing and remitting course

Epidemiology

- 47% of those with substance abuse have mental health problems
- 29% of those with a mental health disorder have a substance use disorder
- 47% of those with schizophrenia and 25% of those with an anxiety disorder have a substance use disorder

Etiology

- almost all drugs (and activities) of abuse increase dopamine in the nucleus accumbens, an action that contributes to their euphoric properties and, with repeated use, to their ability to change signalling pathways in the brain's reward system
- substance use disorders arise from multifactorial interactions between genes (personality, neurobiology) and environment (low socioeconomic status, substance-using peers, abuse history, chronic stress)

Diagnosis

- substance use disorders are measured on a continuum from mild to severe based on the number of criteria met within 12 mo
 - mild: 2-3
 - moderate: 4-5
 - severe: 6 or more
- each specific substance is meant to be addressed as a separate use disorder (e.g. a single patient may have moderate alcohol use disorder, and a mild stimulant use disorder) and diagnosed utilizing the same overarching criteria
- criteria for substance use disorders (PEC WITH MCAT)
 - use despite Physical or psychological problem (e.g. alcoholic liver disease or cocaine related nasal problems)
 - failures in important External roles at work/school/home
 - Craving or a strong desire to use substance
 - Withdrawal
 - continued use despite Interpersonal problems
 - Tolerance, needing to use more substance to get same effect
 - use in physically Hazardous situations
 - More substance used or for longer period than intended
 - unsuccessful attempts to Cut down
 - Activities given up due to substance
 - excessive Time spent on using or finding substance

Classification of Substances

	Drugs	Intoxication	Withdrawal
Depressants	Alcohol, opioids, barbiturates, benzodiazepines, GHB	Euphoria, slurred speech, disinhibition, confusion, poor coordination, coma (severe)	Anxiety, anhedonia, tremor, seizures, insomnia, psychosis, delirium, death
Stimulants	Amphetamines, methylphenidate, MDMA, cocaine	Euphoria, mania, psychomotor agitation, anxiety, psychosis (especially paranoia), insomnia, cardiovascular complications (stroke, MI, arrhythmias), seizure	'Crash', craving, dysphoria, suicidality
Hallucinogens	LSD, mescaline, psilocybin, PCP, ketamine, ibogaine, salvia	Distortion of sensory stimuli and enhancement of feelings, psychosis (+ + visual hallucinations), delirium, anxiety (panic), poor coordination	Usually absent

General Approach to Assessment

- must be appropriate to the patient's current state of change (see [Population Health and Epidemiology](#), [Health Promotion Strategies](#), PH7, for Prochaska's Stages of Change Model)
- patients will only change when the pain of change appears less than the pain of staying the same
- provider can help by providing psychoeducation (emphasize neurobiologic model of addiction), motivation, and hope
- principles of motivational interviewing (see [Psychotherapy](#), PS43)
 - non-judgmental stance
 - space for patient to talk and reflect
 - offer accurate empathic reflections back to patient to help frame issues
- although not explicitly in the substance use disorder criteria, the following questions are important to characterize HPI and safety
 - when was the last time you used? how long can you go without using?
 - by what route (oral ingestion, insufflation, smoking, IV) do you usually use?
 - are there any triggers that you know will cause you to use?
 - how has your substance use affected your work, school, relationships?
 - substances can be very expensive, how do you support your drug use?
 - have you experienced medical or legal consequences of your use?
 - any previous attempts to cut down or quit, did you experience any withdrawal symptoms?

General Approach to Treatment

- encourage and offer referral to evidence based services
 - social: 12-step programs (alcoholics anonymous, narcotics anonymous), family education and support
 - psychological therapy: addiction counselling, motivational enhancement therapy (MET), CBT, contingency management, group therapy, family therapy, marital counseling
 - medical management (differs for substances): acute detoxification, pharmacologic agents to aid maintenance
- harm reduction whenever possible: safe-sex practices, avoid driving while intoxicated, avoiding substances with child care, safe needle practices/exchange, pill-testing kits, reducing tobacco use
- comorbid psychiatric conditions: many will resolve with successful treatment of the substance use disorder but patients who meet full criteria for another disorder should be treated for that disorder with psychological and pharmacologic therapies

Nicotine

- see [Family Medicine](#), FM11

Alcohol

- see [Family Medicine](#), FM13 and [Emergency Medicine](#), ER54

History

- CAGE: validated screening questionnaire
 - C ever felt the need to Cut down on drinking?
 - A ever felt Annoyed at criticism of your drinking?
 - G ever feel Guilty about your drinking?
 - E ever need a drink first thing in morning (Eye opener)?
 - for men, a score of ≥ 2 is a positive screen; for women, a score of ≥ 1 is a positive screen
 - if positive CAGE, then assess further to distinguish between problem drinking and alcohol dependence

Confabulations: the fabrication of imaginary experiences to compensate for memory loss

Table 4. Canada's Low-Risk Alcohol Drinking Guidelines

Moderate Drinking		
Men: 3 or less/d (≤ 15 /wk)	Women: 2 or less/d (≤ 10 /wk)	Elderly: 1 or less/d

Make sure to ask about other alcohols: mouthwash, rubbing alcohol, methanol, ethylene glycol, aftershave (may be used as a cheaper alternative)

Alcohol Intoxication

- legal limit for impaired driving is 10.6 mmol/L (50 mg/dL) reached by 2-3 drinks/h for men and 1-2 drinks/h for women
- coma can occur with >60 mmol/L (non-tolerant drinkers) and 90-120 mmol/L (tolerant drinkers)

A "Standard Drink"
 Spirit (40%): 1.5 oz. or 43 mL
 Table Wine (12%): 5 oz. or 142 mL
 Fortified Wine (18%): 3 oz. or 85 mL
 Regular Beer (5%): 12 oz. or 341 mL

OR

1 pint of beer = 1.5 SD
 1 bottle of wine = 5 SD
 1 "mickey" = 8 SD
 "26-er" = 17 SD
 "40 oz." = 27 SD

Alcohol Withdrawal

- occurs within 12-48 h after prolonged heavy drinking and can be life-threatening
- alcohol withdrawal can be described as having 4 stages, however not all stages may be experienced
 - stage 1 (onset 12-18 h after last drink): "the shakes" tremor, sweating, agitation, anorexia, cramps, diarrhea, sleep disturbance
 - stage 2 (onset 7-48 h): alcohol withdrawal seizures, usually tonic-clonic, non-focal and brief
 - stage 3 (onset 48 h): visual, auditory, olfactory or tactile hallucinations

- stage 4 (onset 3-5 d): delirium tremens, confusion, delusions, hallucinations, agitation, tremors, autonomic hyperactivity (fever, tachycardia, HTN)
- course: almost completely reversible in young; elderly often left with cognitive deficits
- mortality rate 20% if untreated

Management of Alcohol Withdrawal

- monitor using the Clinical Institute Withdrawal Assessment for Alcohol (CIWA-A) scoring system
 - areas of assessment include
 - ♦ physical (5): nausea and vomiting, tremor, agitation, paroxysmal sweats, headache/fullness in head
 - ♦ psychological/cognitive (2): anxiety, orientation/clouding of sensorium
 - ♦ perceptual (3): tactile disturbances, auditory disturbances, visual disturbances
 - all categories are scored from 0-7 (except: orientation/sensorium 0-4), maximum score of 67
 - ♦ mild <10, moderate 10-20, severe >20

Table 5. CIWA-A Scale Treatment Protocol for Alcohol Withdrawal

Basic Protocol	Diazepam 20 mg PO q1-2h prn until CIWA-A < 10 points Observe 1-2 h after last dose and re-assess on CIWA-A scale Thiamine 100 mg IM then 100 mg PO OD for 3 d Supportive care (hydration and nutrition)
History of Withdrawal Seizures	Diazepam 20 mg PO q1h for minimum of three doses regardless of subsequent CIWA scores
If age >65 or patient has severe liver disease, severe asthma or respiratory failure	Use a short acting benzodiazepine Lorazepam PO/SL/IM 1-4 mg q1-2h
If Hallucinations are present	Haloperidol 2-5 mg IM/PO q1-4h – max 5 doses/d or atypical antipsychotics (olanzapine, risperidone) Diazepam 20 mg x 3 doses as seizure prophylaxis (haloperidol lowers seizure threshold)
Admit to Hospital if	Still in withdrawal after >80 mg of diazepam Delirium tremens, recurrent arrhythmias, or multiple seizures Medically ill or unsafe to discharge home

Wernicke-Korsakoff Syndrome

- alcohol-induced amnesic disorders due to thiamine deficiency
- necrotic lesions: mammillary bodies, thalamus, brainstem
- Wernicke's encephalopathy (acute and reversible): triad of nystagmus (CN VI palsy), ataxia, and confusion
- Korsakoff's syndrome (chronic and only 20% reversible with treatment): anterograde amnesia and confabulations; cannot occur during an acute delirium or dementia and must persist beyond usual duration of intoxication/withdrawal
- management
 - Wernicke's: thiamine 100 mg PO OD x 1-2 wk
 - Korsakoff's: thiamine 100 mg PO bid/tid x 3-12 mo

Treatment of Alcohol Use Disorder

- non-pharmacological
 - see *General Approach to Treatment*, PS24
- pharmacological
 - naltrexone (Revia®): opioid antagonist, shown to be successful in reducing the "high" associated with alcohol, moderately effective in reducing cravings, frequency or intensity of alcohol binges
 - disulfiram (Antabuse®): blocks oxidation of alcohol (blocks acetaldehyde dehydrogenase); with alcohol consumption, acetaldehyde accumulates to cause a toxic reaction (vomiting, tachycardia, death); if patient relapses, must wait 48 h before restarting Antabuse®; prescribed only when treatment goal is abstinence. RCT evidence is generally poor or negative
 - acamprosate (Campral®): NMDA glutamate receptor antagonist; useful in maintaining abstinence and decreasing cravings

Delirium Tremens

(alcohol withdrawal delirium)

- Autonomic hyperactivity (diaphoresis, tachycardia, increased respiration)
- Hand tremor
- Insomnia
- Psychomotor agitation
- Anxiety
- Nausea or vomiting
- Tonic-clonic seizures
- Visual/tactile/auditory hallucinations
- Persecutory delusions

OxyNEO vs. OxyContin

As of 2012, OxyContin was no longer available in Canada and was replaced by a new formulation of oxycodone called OxyNEO. OxyNEO is reported to be more tamper-resistant than OxyContin as the tablet is more difficult to crush. Furthermore, if OxyNEO is crushed, and added to water, it forms a thick gel-like substance that cannot be easily injected

Opioids

- types of opioids: heroin, morphine, oxycodone, Tylenol #3® (codeine), hydromorphone, fentanyl
- major risks associated with the use of contaminated needles: increased risk of hepatitis B and C, bacterial endocarditis, HIV/AIDS

Acute Intoxication

- direct effect on receptors in CNS resulting in decreased pain perception, sedation, decreased sex drive, nausea/vomiting, decreased GI motility (constipation and anorexia), and respiratory depression

Toxic Reaction

- typical syndrome includes shallow respirations, miosis, bradycardia, hypothermia, decreased level of consciousness
- management
 - ABCs
 - IV glucose
 - naloxone hydrochloride (Narcan®): 0.4 mg up to 2 mg IV for diagnosis
 - treatment: intubation and mechanical ventilation, ± naloxone drip, until patient alert without naloxone (up to >48 h with long-acting opioids)
- caution with longer half-life; may need to observe for toxic reaction for at least 24 h

Withdrawal

- symptoms: depression, insomnia, drug-craving, myalgias, nausea, chills, autonomic instability (lacrimation, rhinorrhea, piloerection)
- onset: 6-12 h; duration: 5-10 d
- complications: loss of tolerance (overdose on relapse), miscarriage, premature labour
- management: long-acting oral opioids (methadone, buprenorphine), α-adrenergic agonists (clonidine)

Treatment of Opioid Use Disorder

- see *General Approach to Treatment*, PS24
- long-term treatment may include withdrawal maintenance treatment with methadone (opioid agonist) or buprenorphine (mixed agonist-antagonist)
- Suboxone® formulation includes naloxone in addition to buprenorphine, in an effort to prevent injection of the drug. When naloxone is injected, it will precipitate opiate withdrawal and block the opiate effect of buprenorphine; however, it will not have this antagonist action when taken sublingually

Cocaine

- street names: blow, C, coke, crack, flake, freebase, rock, snow
- alkaloid extracted from leaves of the coca plant; blocks presynaptic uptake of dopamine (causing euphoria), norepinephrine and epinephrine (causing vasospasm, HTN)
- self-administered by inhalation, insufflation, or intravenous route

Intoxication

- elation, euphoria, pressured speech, restlessness, sympathetic stimulation (e.g. tachycardia, mydriasis, sweating)
- prolonged use may result in paranoia and psychosis

Overdose

- medical emergency: HTN, tachycardia, tonic-clonic seizures, dyspnea, and ventricular arrhythmias
- treatment with IV diazepam to control seizures and propranolol or labetalol to manage HTN and arrhythmias

Withdrawal

- initial “crash” (1-48 h): increased sleep, increased appetite
- withdrawal (1-10 wk): dysphoric mood plus fatigue, irritability, vivid unpleasant dreams, insomnia or hypersomnia, psychomotor agitation or retardation
- complications: relapse, suicide (significant increase in suicide during withdrawal period)
- management: supportive management

Treatment of Cocaine Use Disorder

- see *General Approach to Treatment*, PS24
- no pharmacologic agents have widespread evidence or acceptance of use

Complications

- cardiovascular: arrhythmias, MI, CVA, ruptured AAA
- neurologic: seizures
- psychiatric: psychosis, paranoia, delirium, suicidal ideation
- other: nasal septal deterioration, acute/chronic lung injury “crack lung”, possible increased risk of connective tissue disease

Opioid Antagonists Naltrexone vs. Naloxone

Naltrexone (Revia®)

- Used for opioid and EtOH dependence
- Long half life (h)

Naloxone (Narcan®)

- Used for life-threatening CNS/respiratory depression in opioid overdose
- Short half life (<1 h)
- Very fast acting (min)
- High affinity for opioid receptor
- Induces opioid withdrawal symptoms

Maintenance Medication for Opiate Addiction: The Foundation of Recovery

J Addict Dis 2012;31:207-225

Study: Review.

Discussion: Maintenance treatment of opioid addiction with methadone or buprenorphine is associated with retention in treatment, reduction in illicit opiate use, decreased craving, and improved social function. Recently, studies showing extended release naltrexone injections have showed some promise.

Common Presentations of Drug Use

System	Findings
General	Weight loss (especially cocaine, heroin) Injected conjunctiva (cannabis) Pinpoint pupils (opioids) Track marks (injection drugs)
MSK	Trauma
GI	Viral hepatitis (injection drugs) Unexplained elevations in ALT (injection drugs)
Behavioural	Missed appointments Non-compliance Drug-seeking (especially benzodiazepines, opioids)
Psychological	Insomnia Fatigue Depression Flat affect (benzodiazepines, barbiturates) Paranoia (cocaine) Psychosis (cocaine, cannabis, hallucinogens)
Social	Marital discord Family violence Work/school Absenteeism and poor performance

Amphetamines

- includes prescription medications for ADHD such as Ritalin® and Adderall®
- intoxication characterized by euphoria, improved concentration, sympathetic and behavioural hyperactivity and at high doses can mimic psychotic mania, can eventually cause coma
- chronic use can produce a paranoid psychosis which can resemble schizophrenia with agitation, paranoia, delusions and hallucinations
- withdrawal symptoms include dysphoria, fatigue, and restlessness
- treatment of amphetamine induced psychosis: antipsychotics for acute presentation, benzodiazepines for agitation, β -blockers for tachycardia, hypertension

Cannabis

- cannabis (marijuana) is the most commonly used illicit drug
- psychoactive substance: delta-9-tetrahydrocannabinol (Δ^9 -THC)
- intoxication characterized by tachycardia, conjunctival vascular engorgement, dry mouth, altered sensorium, increased appetite, increased sense of well-being, euphoria/laughter, muscle relaxation, impaired performance on psychomotor tasks including driving
- high doses can cause depersonalization, paranoia, anxiety and may trigger psychosis and schizophrenia if predisposed
- chronic use associated with tolerance and an apathetic, amotivational state, increases risk of later manic episodes
- cessation following heavy use does produce a significant withdrawal syndrome: irritability, anxiety, insomnia, decreased food intake
- treatment of cannabis use disorder: see *General Approach to Assessment*, PS24

Hallucinogens

- types of hallucinogens by primary action
 - 5-HT_{2A} agonists: LSD, mescaline (peyote), psilocybin mushrooms, DMT (ayahuasca)
 - NMDA antagonists: PCP, ketamine
 - κ -opioid agonists: salvia divinorum, ibogaine
- 5-HT_{2A} agonists are most commonly used, intoxication characterized by tachycardia, HTN, mydriasis, tremor, hyperpyrexia, and a variety of perceptual, mood and cognitive changes (rarely, if ever, deadly; treat vitals symptomatically)
- psychological effects of high doses: depersonalization, derealization, paranoia, and anxiety (panic with agoraphobia)
- tolerance develops rapidly (hours-days) to most hallucinogens so physical dependency is virtually impossible, although psychological dependency and problematic usage patterns can still occur
- no specific withdrawal syndrome characterized
- management of acute intoxication
 - support, reassurance, diminished stimulation; benzodiazepines or high potency antipsychotics seldom required (if used, use small doses), minimize use of restraints
- long term adverse effects: controversial role in triggering psychiatric disorders, particularly mood or psychosis, thought to be chiefly in individuals with genetic or other risk factors
- **Hallucinogen Persisting Perception Disorder:** DSM-5 diagnosis characterized by long lasting, spontaneous, intermittent recurrences of visual perceptual changes reminiscent of those experienced with hallucinogen exposure

“Club Drugs”

Table 6. The Mechanism and Effects of Common “Club Drugs”

Drug	Mechanism	Effect	Adverse Effects
MDMA (“Ecstasy”, “X”, “E”)	Acts on serotonergic and dopaminergic pathways, properties of a hallucinogen and stimulant	Enhanced sensorium; feelings of well-being, empathy	Sweating, tachycardia fatigue, muscle spasms (especially jaw clenching), ataxia, hyperthermia, arrhythmias, DIC, rhabdomyolysis, renal failure, seizures, death
Gamma Hydroxybutyrate (GHB, “G”, “Liquid Ecstasy”)	Biphasic dopamine response (inhibition then release) and releases opiate-like substance	Euphoric effects, increased aggression, impaired judgment	Sweating, tachycardia, fatigue, muscle spasms (especially jaw clenching), ataxia, severe withdrawal from abrupt cessation of high doses: tremor, seizures, psychosis
Flunitrazepam (Rohypnol®, “Roofies”, “Rope”, “The Forget Pill”)	Potent benzodiazepine, rapid oral absorption	Sedation, psychomotor impairment, amnesic effects, decreased sexual inhibition	CNS depression with EtOH
Ketamine (“Special K”, “Kit-Kat”)	NMDA receptor antagonist, rapid-acting general anesthetic used in pediatrics and by veterinarians	“Dissociative” state, profound amnesia/analgesia; hallucinations and sympathomimetic effects	Psychological distress, accidents due to intensity of experience and lack of bodily control, in overdose, decreased LOC, respiratory depression, catatonia

Cannabinoid Hyperemesis Syndrome

An interesting and relatively new clinical phenomenon associated with chronic cannabis use characterized by cyclical, recurrent severe nausea, vomiting, and colicky pain. Possibly due to increased potency of available THC products. Patients often present to ED in acute distress with no evidence of specific GI pathology. Many patients will successfully self-medicate with hot baths or showers

Medical Uses of Marijuana

- Anorexia-cachexia (AIDS, cancer)
- Spasticity, muscle spasms (multiple sclerosis, spinal cord injury)
- Levodopa-induced dyskinesia (Parkinson's Disease)
- Controlling tics and obsessive-compulsive behaviour (Tourette's syndrome)
- Reducing intra-ocular pressure (glaucoma)

Cannabis Use and Risk of Psychotic or Affective Mental Health Outcomes: A Systematic Review

The Lancet 2007;370:319-328

Purpose: To review the evidence for cannabis use and occurrence of psychotic or affective mental health outcomes.

Study Characteristics: A meta-analysis of 35 population-based longitudinal studies, or case-control studies nested within longitudinal designs.

Results: There was an increased risk of any psychotic outcome in individuals who had ever used cannabis (pooled adjusted odds ratio = 1.41, 95% CI 1.20-1.65). Findings were consistent with a dose-response effect, with greater risk in people who used cannabis more frequently (2.09, 95% CI, 1.54-2.84). Findings for depression, suicidal thoughts, and anxiety outcomes were less consistent. In both cases (psychotic and affective outcomes), a substantial confounding effect was present.

Conclusions: The findings are consistent with the view that cannabis increases risk of psychotic outcomes independent of transient intoxication effects, although evidence is less strong for affective outcomes. Although cannabis use and the development of psychosis are strongly associated, it is difficult to determine causality and it is possible that the association results from confounding factors or bias. The authors did conclude that there is sufficient evidence to warn young people that using cannabis could increase their risk of developing a psychotic illness later in life.

Date Rape Drugs

- GHB
- Flunitrazepam (Rohypnol®)
- Ketamine

Emerging Medical Uses of Hallucinogens

Many hallucinogens are currently under investigation for therapeutic benefit; LSD & Psilocybin for end of life anxiety, MDMA for PTSD, Ketamine for rapid treatment of depression, ibogaine derivatives for addiction

Table 6. The Mechanism and Effects of Common “Club Drugs” (continued)

Drug	Mechanism	Effect	Adverse Effects
Methamphetamine (“speed”, “meth”, “chalk”, “ice”, “crystal”)	Amphetamine stimulant, induces norepinephrine, dopamine, and serotonin release	Rush begins in min, effects last 6-8 h, increased activity, decreased appetite, general sense of well-being, tolerance occurs quickly, users often binge and crash	Short-term use: high agitation, rage, violent behaviour, occasionally hyperthermia and convulsions Long-term use: addiction, anxiety, confusion, insomnia, paranoia, auditory and tactile hallucinations (especially formication), delusions, mood disturbance, suicidal and homicidal thoughts, stroke, may be contaminated with lead, and IV users may present with acute lead poisoning
Phencyclidine (“PCP”, “angel dust”)	Not understood, used by veterinarians to immobilize large animals	Amnestic, euphoric, hallucinatory state	Horizontal/vertical nystagmus, myoclonus, ataxia, autonomic instability (treat with diazepam IV), prolonged agitated psychosis (treat with haloperidol); high risk for suicide; violence towards others High dose can cause coma

Formication

Tactile hallucination that insects or snakes are crawling over or under the skin (especially associated with crystal meth use)

Somatic Symptom and Related Disorders

General Characteristics

- physical signs and symptoms lacking objective medical support in the presence of psychological factors that are judged to be important in the initiation, exacerbation, or maintenance of the disturbance
- cause significant distress or impairment in functioning
- symptoms are produced unconsciously and are not the result of malingering or factitious disorder, which are disorders of voluntary “faking” of symptoms (or intentionally inducing, e.g. injecting feces) for secondary gain
- primary gain: somatic symptom represents a symbolic resolution of an unconscious psychological conflict; serves to reduce anxiety and conflict with no external incentive
- secondary gain: the sick role; external benefits obtained or unpleasant duties avoided (e.g. work)

Malingering: intentional production of false or grossly exaggerated physical or psychological symptoms, motivated by external reward (e.g. avoiding work, obtaining financial compensation, or obtaining drugs)

Factitious Disorder: intentional production or feigning of physical or psychological signs or symptoms

Management of Somatic Symptom and Related Disorders

- brief, regular scheduled visits with GP to facilitate therapeutic relationship and help patient feel cared for
- limit number of physicians involved in care, minimize medical investigations; coordinate necessary investigations
- emphasis on what the patient can change and control; the psychosocial coping skills, not their physical symptoms (functional recovery > explanation of symptoms)
- do not tell patient it is “all in their head,” emphasize these disorders are real entities or functional in nature
- psychotherapy: CBT, mindfulness interventions, biofeedback, conflict resolution
- minimize psychotropic drugs: anxiolytics in short-term only, antidepressants for comorbid depression and anxiety

Somatic Symptom Disorder

DSM-5 Diagnostic Criteria for Somatic Symptom Disorder

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, 5th ed. 2013. American Psychiatric Association

- one or more somatic symptoms that are distressing or result in significant disruption of daily life
 - excessive thoughts, feelings, or behaviours related to the somatic symptoms or associated health concerns as manifested by at least one of the following
 - disproportionate and persistent thoughts about the seriousness of one’s symptoms
 - persistently high level of anxiety about health or symptoms
 - excessive time and energy devoted to these symptoms or health concerns
 - although any one somatic symptom may not be continuously present, the state of being symptomatic is persistent (typically >6 mo)
- **specify: With predominant pain** (previously pain disorder) for those whose somatic symptom is primarily pain
 - patients have physical symptoms and believe these symptoms represent the manifestation of a serious illness
 - they will persist in this belief despite negative medical investigations and may develop different symptoms over time
 - lifetime prevalence may be around 5-7% in the general adult population
 - females tend to report more somatic symptoms than males do, cultural factors may influence sex ratio
 - complications: anxiety and depression commonly comorbid (up to 80%), unnecessary medications or surgery
 - often a misdiagnosis for an insidious illness so rule out all organic illnesses (e.g. multiple sclerosis)

Illness Anxiety Disorder

- preoccupation with fear of having, or the idea that one has, a serious disease, to the point of causing significant impairment
- convictions persist despite negative investigations and medical reassurance
- somatic symptoms are mild or not present
- there is a high level of anxiety about health and the individual is easily alarmed about personal health status
- person engages in maladaptive behaviour such as excessive physical checking or total healthcare avoidance
- duration is ≥ 6 mo; onset in 3rd-4th decade of life
- a new diagnostic entity so epidemiology is not well known; however, it is likely less common than SSD
- possible role for SSRIs due to generally high level of anxiety

Conversion Disorder

(Functional Neurological Symptom Disorder)

- one or more symptoms or deficits affecting voluntary motor or sensory function that mimic a neurological or GMC (e.g. impaired coordination, local paralysis, double vision, seizures, or convulsions)
- does not need to be preceded by a psychological event as per previous DSM criteria, however this is still worth exploring as many patients will present after such an event or related to a medical diagnosis in a first-degree relative
- 2-5/100,000 in general population; 5% of referrals to neurology clinics
- more common in rural populations and in individuals with little medical knowledge
- spontaneous remission in 95% of acute cases, 50% of chronic cases (>6 mo)
- key to diagnosis is specific neurological testing to detect incompatible findings (e.g. Hoover's sign, dermatome testing)

la belle indifférence

An inappropriately cavalier patient attitude in the face of serious symptoms. Classically associated with conversion disorder

Table 7. Differential of Somatic Symptom and Related Disorders

	Somatic Symptom Disorder	Illness Anxiety Disorder	Conversion Disorder	Factitious Disorder	Malingering
Somatic Symptoms	Present	Mild or absent	Neurologic, voluntary motor or sensory	Psychological or physical	Psychological or physical
Symptoms Produced	Unconsciously	Unconsciously	Unconsciously	Consciously	Consciously
Physical Findings	Absent	Absent	Incompatible	Possible, attempts to falsify	Possible, attempts to falsify

Dissociative Disorders

Definition

- dissociation so severe that the usually integrated functions of consciousness and perception of self break down
- differential diagnosis: PTSD, acute stress disorder, borderline personality disorder, somatization disorder, substance abuse, GMC (various neurologic disorders including complex/partial seizures, migraine, Cotard syndrome)

Dissociative Identity Disorder

- disruption of identity characterized by two or more distinct personality states or an experience of possession
- can manifest as sudden alterations in sense of self and agency (ego-dystonic emotions, behaviours, speech)
- features recurrent episodes of amnesia (declarative or procedural)

Dissociative Amnesia

- inability to recall important autobiographical information, usually of a traumatic or stressful nature, that is inconsistent with normal forgetting. Not attributable to other psychiatric disorder or medical illness
- **localized/selective amnesia:** failure to recall all/some events during a prescribed period of time
- **generalized amnesia:** (more rare) complete loss of memory for one's life history, \pm procedural, semantic knowledge. Usually sudden onset. Often will present with perplexity, disorientation, aimless wandering

Depersonalization/Derealization Disorder

- persistent or recurrent episodes of one or both of
 - **depersonalization:** experiences of detachment from oneself, feelings of unreality, or being an outside observer to one's thoughts, feelings, speech, and actions (can feature distortions in perception including time, as well as emotional and physical numbing)
 - **derealization:** experiences of unreality or detachment with respect to the surroundings (e.g. feeling as if in a dream, or that the world is not real, external visual world is foggy or distorted)
- transient (seconds-hours) experiences of this nature are quite common in the general population
- episodes can range from hours-years, patients are often quite distressed and verbalize concern of "going crazy"

Fugue

Purposeful travel or bewildered wandering while in amnesic state

During depersonalization or derealization patients usually have intact reality testing, which adds to their alarming nature

Sleep Disorders

- for more information regarding normal sleep cycles and the illnesses described, see [Neurology, Sleep Disorders, N48](#)

Overview

- adequate sleep is essential to functioning; deprivation can lead to cognitive impairment and can contribute to death
- circadian rhythms help regulate mood and cognitive performance
- neurotransmitters commonly implicated in psychiatric illnesses also regulate sleep
 - acetylcholine activity and decreased activity of monoamine neurotransmitters is associated with greater REM sleep
 - decreased adrenergic and cholinergic activity are associated with NREM sleep
- depression is associated with decreased delta (deep, slow-wave) sleep, decreased REM latency, and increased REM density
- criteria
 - must cause significant distress or impairment in functioning
 - not due to a GMC or medications/drugs (unless specified)

Management

- pharmacological treatments are illness-specific
 - non-benzodiazepines preferable (e.g. trazodone, zopiclone, quetiapine), but benzodiazepines a short term option
 - medication should not be prescribed without having first made a diagnosis and considering major psychiatric illnesses (major depression and alcohol use disorders are common etiologies)
- sleep hygiene is a simple, effective but often underutilized method for addressing sleep disturbances. Recommendations include
 - waking up and going to bed at same time every day, including on weekends
 - avoiding long periods of wakefulness in bed
 - not using bed for non-sleep activities (reading, TV, work)
 - avoiding napping
 - discontinuing or reducing consumption of alcohol, caffeine, drugs
 - exercising at least 3-4x per week (but not in the evening, if this interferes with sleep)

Table 8. Major DSM 5 Sleep-Wake Disorders

Note: For more information regarding specific disorders, see: *Neurology, Sleep Disorders, N48; Family Medicine, Sleep Disorders, FM48; and Respiriology, Sleep Apnea, R31*

Category	Disorder	Description
(Uncategorized)	Insomnia disorder	Difficulty sleeping
	Hypersomnolence disorder	Feeling sleepy throughout the day
	Narcolepsy	Recurrent attacks of irrepresible need to sleep
	Circadian rhythm sleep-wake disorders	Insomnia or excessive sleepiness due to misalignment or alteration in endogenous circadian rhythm
	Restless legs syndrome	Uncomfortable, frequent urge to move legs at night
	Substance/medication-induced sleep disorder	Disturbance in sleep (insomnia or daytime sleepiness) caused by substance/medication intoxication or withdrawal
Breathing-related sleep disorders	Obstructive sleep apnea hypopnea	Breathing issues due to obstruction
	Central sleep apnea	Breathing issues due to aberrant brain signaling
	Sleep-related hypoventilation	Breathing issues due to decreased responsiveness to carbon dioxide levels
Parasomnias	Non-rapid eye movement sleep arousal disorders	Incomplete awakening from sleep, complex motor behaviour without conscious awareness; amnesia regarding episodes; includes symptoms of Sleepwalking: rising from bed and walking about, blank face, unresponsive, awakened with difficulty Sleep terrors: recurrent episodes of abrupt terror arousals from sleep, usually beginning with a panicky scream, intense fear and autonomic arousal, relative unresponsiveness to comfort during episodes Specifiers: sleep-related sexual behaviour (sexsomnia) and sleep-related eating
	Nightmare disorder	Repeated extended, extremely dysphoric, often very vivid, well-remembered dreams that usually involve significant threats; rapid orientation and alertness on awakening with autonomic arousal
	Rapid eye movement sleep behaviour disorder	Arousal during sleep, associated with vocalization and/or complex motor behaviours; can cause violent injuries; rapid orientation and alertness on awakening

Sexuality and Gender

Gender Dysphoria

Definition

- the distress that may coincide with conflict between one's experienced/expressed gender and one's assigned gender

Typical Presentation

- strong and persistent cross-gender identification
- desire to be rid of primary/secondary sex characteristics and to gain the primary/secondary sex characteristics of their identified gender
- repeated stated desire or insistence that one is of the opposite sex
- preference for cross-dressing, cross-gender roles in make-believe play
- intense desire to participate in the stereotypical games and pastimes of the opposite sex
- strong preference for playmates of the opposite sex
- significant distress or impairment in functioning and persistent discomfort with his or her sex or gender role

Treatment

- psychotherapy
- hormonal therapy
- sexual reassignment surgery

Paraphilic Disorders

Definition

- intense and persistent sexual interest other than sexual interest in genital stimulation or preparatory fondling with phenotypically normal, physically mature, consenting human partners
- paraphilic disorder:** paraphilia that causes distress or functional impairment to the individual, or a paraphilia whose realization entails personal harm, or risk of harm to others

- **subtypes:** voyeuristic, exhibitionistic, frotteuristic, sexual masochism, sexual sadism, pedophilic, fetishistic, transvestic, other specified paraphilic disorder, unspecified paraphilic disorder
- rarely self-referred; come to medical attention through interpersonal or legal conflict
- person usually has more than one paraphilia; 5% of paraphilias attributed to women
- typical presentation
- begins in childhood or early adolescence; increasing in complexity and stability with age
- chronic, decreases with advancing age but may increase with stress

Treatment

- anti-androgen drugs
- behaviour modification
- psychotherapy

SEXUAL DYSFUNCTION

- see [Gynecology](#), GY33 and [Urology](#), U30

Eating Disorders

Epidemiology

- anorexia nervosa (AN): 1% of adolescent and young adult females; onset 13-20 yr old
- bulimia nervosa (BN): 2-4% of adolescent and young adult females; onset 16-18 yr old
- F:M=10:1; mortality 5-10%

Etiology

- multifactorial: psychological, sociological, and biological associations
- individual: perfectionism, lack of control in other life areas, history of sexual abuse
- personality: obsessive-compulsive, histrionic, borderline
- familial: maintenance of weight equilibrium and control in dysfunctional family
- cultural factors: prevalent in industrialized societies, idealization of thinness in the media
- genetic factors
 - AN: 6% prevalence in siblings, with one study of twin pairs finding concordance in 9 of 12 monozygotic pairs versus concordance in 1 of 14 dizygotic pairs
 - BN: higher familial incidence of affective disorders than the general population

Risk Factors

- physical factors: obesity, chronic medical illness (e.g. DM)
- psychological factors: individuals who by career choice are expected to be thin, family history (mood disorders, eating disorders, substance abuse), history of sexual abuse (especially for BN), homosexual males, competitive athletes, concurrent associated mental illness (depression, OCD, anxiety disorder [especially panic and agoraphobia], substance abuse [specifically for BN])

Anorexia Nervosa

DSM-5 Diagnostic Criteria for Anorexia Nervosa

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, 5th ed. 2013. American Psychiatric Association

- intake and weight: restriction of energy intake relative to requirements, leading to a significantly low body weight in the context of age, sex, developmental trajectory, and physical health. Significantly low weight is defined as a weight that is less than minimally normal or, for children and adolescents, less than that minimally expected
 - fear or behaviour: intense fear of gaining weight or of becoming fat, or persistent behaviour that interferes with weight gain, even though at a significantly low weight
 - perception: disturbance in the way in which one's body weight or shape is experienced, undue influence of body weight or shape on self-evaluation, or persistent lack of recognition of the seriousness of the current low body weight
- **specifiers:** partial remission, full remission, severity based on BMI (mild = BMI >17 kg/m², moderate = BMI 16-16.99 kg/m², severe = BMI 15-15.99 kg/m², extreme = BMI <15 kg/m²), type (restricting = during last 3 mo no episodes of binge-eating or purging vs. binge-eating/purging type = in last 3 mo have participated in recurrent episodes of binge-eating/purging)

Athletic Triad

- Disordered eating
- Amenorrhea
- Osteoporosis

Some patients with insulin-dependant DM may stop their insulin in order to lose weight

Management

- psychotherapy: individual, group, family (gold standard): address food and body perception, coping mechanisms, health effects
- medications of little value
- outpatient programs and inpatient programs are available
- inpatient hospitalization for treatment of eating disorders is rarely on an acute basis (unless there is a concurrent psychiatric reason for emergent admission e.g. suicide risk)
- admit to a medical ward for hospitalization: $<65\%$ of standard body weight ($<85\%$ of standard body weight for adolescents), hypovolemia requiring intravenous fluid, heart rate <40 bpm, abnormal serum chemistry or if actively suicidal
- agree on target body weight on admission and reassure this weight will not be surpassed
- monitor for complications of AN (see [Table 9](#))
- monitor for refeeding syndrome

- a potentially life-threatening metabolic response to refeeding in severely malnourished patients resulting in severe shifts in fluid and electrolyte levels
- complications include hypophosphatemia, congestive heart failure, cardiac arrhythmias, delirium, and death
- prevention: slow refeeding, gradual increase in nutrition, supplemental phosphorus, close monitoring of electrolytes and cardiac status

Prognosis

- early intervention much more effective (adolescent onset has much better prognosis than adult onset)
- 1 in 10 adolescents continue to have anorexia nervosa as adults
- with treatment, 70% resume a weight of at least 85% of expected levels and about 50% resume normal menstrual function
- eating peculiarities and associated psychiatric symptoms are common and persistent
- long-term mortality: 10-20% of patients hospitalized will die in next 10-30 yr (secondary to severe and chronic starvation, metabolic or cardiac catastrophes, with a significant proportion committing suicide)

Bulimia Nervosa

DSM-5 Diagnostic Criteria for Bulimia Nervosa

Reprinted with permission from the Diagnostic and Statistical Manual of Mental Disorders, 5th ed. 2013. American Psychiatric Association

- recurrent episodes of binge-eating; an episode of binge-eating is characterized by both of the following
 - eating, in a discrete period of time, an amount of food that is definitely larger than what most individuals would eat during a similar period of time and under similar circumstances
 - a sense of lack of control over eating during the episode
 - recurrent inappropriate compensatory behaviour in order to prevent weight gain, such as self-induced vomiting, misuse of laxatives, diuretics, enemas, or other medications, fasting, or excessive exercise
 - the binge-eating and inappropriate compensatory behaviours both occur, on average, at least once a week for 3 mo
 - self-evaluation is unduly influenced by body shape and weight
 - the disturbance does not occur exclusively during episodes of AN
- **specifiers:** partial remission, full remission, severity (mild = 1-3 inappropriate compensatory behaviours/wk, moderate = 4-7 inappropriate compensatory behaviours/wk, severe = 8-13 inappropriate compensatory behaviours/wk, extreme = 14+ inappropriate compensatory behaviours/wk)

Associated Features

- fatigue and muscle weakness due to repetitive vomiting and fluid/electrolyte imbalance
- tooth decay
- swollen appearance around angle of jaw and puffiness of eye sockets due to fluid retention
- reddened knuckles, Russell's sign (knuckle callus from self-induced vomiting)
- trouble concentrating
- weight fluctuation over time

Management

- admission for significant electrolyte abnormalities
- biological: treatment of starvation effects, SSRIs (fluoxetine most evidence) as adjunct
- psychological: develop trusting relationship with therapist to explore personal etiology and triggers, CBT, family therapy, recognition of health risks
- social: challenge destructive societal views of women, use of hospital environment to provide external patterning for normative eating behaviour

Prognosis

- relapsing/remitting disease
- good prognostic factors: onset before age 15, achieving a healthy weight within 2 yr of treatment
- poor prognostic factors: later age of onset, previous hospitalizations, individual and familial disturbance
- 60% good treatment outcome, 30% intermediate outcome, 10% poor outcome

Binge-Eating Disorder

Definition

- recurrent episodes of binge-eating (as defined by criteria A of BN) that are associated with eating much more rapidly than normal, eating until feeling uncomfortably full, eating large amounts when not physically hungry, eating alone because embarrassed by how much one is eating, feeling disgusted with oneself/depressed/very guilty afterwards at least once/wk x 3 mo
- not associated with any compensatory behaviours
- dieting usually follows binge-eating (vs. BN where dysfunctional dieting typically precedes binge-eating)
- associated with health consequences (e.g. increased risk of weight gain, obesity)

Epidemiology

- F:M = 2:1
- begins in adolescence or young-adulthood

Treatment

- hallmark is CBT

Avoidant/Restrictive Food Intake Disorder

Definition

- eating/feeding disturbance to the point that there is persistent failure to meet appropriate nutritional and/or energy needs such that individual experiences significant weight loss/growth failure, have nutritional deficiencies, may become dependent on enteral feeding/oral nutritional supplementation, has a marked interference with psychosocial functioning
 - does not occur during an episode of AN or BN
 - no evidence of distress in the way in which one's body weight or shape is experienced

Risk Factors

- temperament (e.g. anxiety disorders), environment (e.g. familial anxiety), genetic (e.g. history of GI conditions)
- begins in infancy and can persist into adulthood

Treatment

- watchful waiting
- behaviour modification
- psychotherapy

Points for Differentiating Between Eating Disorders

- AN of binge-eating/purging type (significantly low body weight) takes priority over a BN diagnosis (body weight not in criteria)
- BN requires compensatory behaviours
- Binge eating disorder does not involve compensatory behaviours
- Avoidant/restrictive food intake disorder does not involve disturbances in body image

Table 9. Physiologic Complications of Eating Disorders

System	Starvation/Restriction	Binge-Purge
General	Low BP, low HR, significant orthostatic changes ± syncopal episodes, low temperature, vitamin deficiencies	Russell's sign (knuckle callus) Parotid gland enlargement Perioral skin irritation Periocular and palatal petechiae Loss of dental enamel and caries Aspiration pneumonia Metabolic alkalosis secondary to hypokalemia and loss of acid
Endocrine	Primary or secondary amenorrhea, decreased T ₃ /T ₄	
Neurologic	Grand mal seizure (decreased Ca ²⁺ , Mg ²⁺ , PO ₄ ³⁻)	
Cutaneous	Dry skin, lanugo hair, hair loss or thinning, brittle nails, yellow skin from high carotene	
GI	Constipation, GERD, delayed gastric emptying	Acute gastric dilation/rupture, pancreatitis, GERD, hematemesis secondary to Mallory-Weiss tear
CVS	Arrhythmias, CHF	Arrhythmias, cardiomyopathy (from use of ipecac), sudden cardiac death (decreased K ⁺)
MSK	Osteoporosis secondary to hypogonadism	Muscle wasting
Renal	Pre-renal failure (hypovolemia), renal calculi	Renal failure (electrolyte disturbances)
Extremities	Pedal edema (decreased albumin)	Pedal edema (decreased albumin)
Lab Values	Starvation: decreased RBCs, decreased WBCs, decreased LH, decreased FSH, decreased estrogen, decreased testosterone, increased growth hormone, increased cholesterol Dehydration: increased BUN	Vomiting: decreased Na ⁺ , decreased K ⁺ , decreased Cl ⁻ , decreased H ⁺ , increased amylase; hypokalemia with metabolic alkalosis Laxatives: decreased Na ⁺ , decreased K ⁺ , decreased Cl ⁻ , increased H ⁺ ; metabolic acidosis

Important electrolytes in eating disorders: KPMg (potassium, phosphate, magnesium)

Personality Disorders

- an evolving personality disorder literature describes that personality is better understood using a trait-based dimensional approach (e.g. 5 major traits such as extraversion, agreeableness, conscientiousness, neuroticism, and openness to experiences rated on a continuum of dysfunctional effects) rather than discrete categories; however, the discrete categories still remain in the current DSM and will be referenced here

General Information

- an enduring pattern of inner experience and behaviour that deviates markedly from the expectations of the individual's culture; manifested in two or more of: cognition, affect, interpersonal functioning, impulse control
- inflexible and pervasive across a range of situations
- pattern is stable and well established by adolescence or early adulthood (vs. a sudden onset)
- associated with many complications, such as depression, suicide, violence, brief psychotic episodes, multiple drug use, and treatment resistance
- relationship building and establishing boundaries are important; focus should be placed on validating, finding things to be truly empathetic about, and speaking to strengths
- mainstay of treatment is psychotherapy with the addition of pharmacotherapy to treat associated axis I disorders (i.e. depression, anxiety, substance abuse)

A flag for personality disorders in clinical setting is the reaction that a patient is eliciting in you

Classification

- personality disorders are divided into three clusters (A, B, and C), with shared features among disorders within each

Personality disorders with familial associations: Schizotypal, Antisocial, and Borderline

Table 10. Description and Diagnosis of Personality Disorders

Cluster A "Mad" Personality Disorders <ul style="list-style-type: none"> • Patients seem odd, eccentric, withdrawn • Familial association with psychotic disorders • Common defense mechanisms: intellectualization, projection, magical thinking 	
Paranoid Personality Disorder (0.5-3%) Pervasive distrust and suspiciousness of others, interpret motives as malevolent Blame problems on others and seem angry and hostile Diagnosis requires 4+ of: SUSPECT <ol style="list-style-type: none"> 1. Suspicious that others are exploiting or deceiving them 2. Unforgiving (bears grudges) 3. Spousal infidelity suspected without justification 4. Perceive attacks on character, counterattacks quickly 5. Enemies or friends? Preoccupied with acquaintance trustworthiness 6. Confiding in others is feared 7. Threats interpreted in benign remarks 	Schizotypal Personality Disorder (3-5.6%) Pattern of eccentric behaviours, peculiar thought patterns Diagnosis requires 5+ of: ME PECULIAR <ol style="list-style-type: none"> 1. Magical thinking 2. Experiences unusual perceptions (including body illusions) 3. Paranoid ideation 4. Eccentric behaviour or appearance 5. Constricted or inappropriate affect 6. Unusual thinking/speech (e.g. vague, stereotyped) 7. Lacks close friends 8. Ideas of reference 9. Anxiety in social situations (Note: Rule out psychotic/pervasive developmental disorders - this is not part of the criteria)
Schizoid Personality Disorder Neither desires nor enjoys close relationships including being a part of a family; prefers to be alone Lifelong pattern of social withdrawal Seen as eccentric and reclusive with restricted affect Diagnosis requires 4 of: DISTANT <ol style="list-style-type: none"> 1. Detached/flat affect, emotionally cold 2. Indifferent to praise or criticism 3. Sexual experiences of little interest 4. Tasks done solitarily 5. Absence of close friends (other than first-degree relatives) 6. Neither desires nor enjoys close relationships (including family) 7. Takes pleasure in few (if any) activities 	

Table 10. Description and Diagnosis of Personality Disorders (continued)

Cluster B "Bad" Personality Disorders

- Patients seem dramatic, emotional, inconsistent
- Familial association with mood disorders
- Common defense mechanisms: denial, acting out, regression (histrionic PD), splitting (borderline PD), projective identification, idealization/devaluation

Borderline Personality Disorder (2-4%)

Unstable moods and behaviour, feel alone in the world, problems with self-image. History of repeated suicide attempts, self-harm behaviours. Inpatients commonly report history of sexual abuse. Tends to fizzle out as patients age. DBT is the principal treatment (see *Psychotherapy*, PS43)

10% suicide rate

Diagnosis requires 5+ of: **IMPULSIVE**

1. Impulsive (min. 2 self-damaging ways, e.g. sex/drugs/spending)
2. Mood/affect instability
3. Paranoia or dissociation under stress
4. Unstable self-image
5. Labile intense relationships
6. Suicidal gestures / self-harm
7. Inappropriate anger
8. aVoiding abandonment (real or imagined, frantic efforts to)
9. Emptiness (feelings of)

Narcissistic Personality Disorder (2%)

Sense of superiority, needs constant admiration, lacks empathy, but with fragile sense of self. Consider themselves "special" and will exploit others for personal gain

Diagnosis requires 5+ of: **GRANDIOSE**

1. Grandiose
2. Requires excessive admiration
3. Arrogant
4. Needs to be special (and associate with other specials)
5. Dreams of success, power, beauty, love
6. Interpersonally exploitative
7. Others (lacks empathy, unable to recognize feelings/needs of)
8. Sense of entitlement
9. Envious (or believes others are envious)

Antisocial Personality Disorder (M: 3%, F: 1%)

Lack of remorse for actions, manipulative and deceitful, often violate the law. May appear charming on first impression. Pattern of disregard for others and violation of others' rights must be present before age 15; however, for the diagnosis of ASPD patients must be at least 18. Strong association with Conduct Disorder, history of trauma/abuse common (see *Child Psychiatry*)

Diagnosis requires 3+ of: **CORRUPT**

1. Cannot conform to law
2. Obligations ignored (irresponsible)
3. Reckless disregard for safety
4. Remorseless
5. Underhanded (deceitful)
6. Planning insufficient (impulsive)
7. Temper (irritable and aggressive)

Histrionic Personality Disorder (1.3-3%)

Attention-seeking behaviour and excessively emotional. Are dramatic, flamboyant, and extroverted. Cannot form meaningful relationships. Often sexually inappropriate

Diagnosis requires 5+ of: **ACTRESS**

1. Appearance used to attract attention
2. Center of attention (else uncomfortable)
3. Theatrical
4. Relationships (believed to be more intimate than they are)
5. Easily influenced
6. Seductive behaviour
7. Shallow expression of emotions (which rapidly shift)
8. Speech (impressionistic and vague)

Cluster C "Sad"

- Patients seem anxious, fearful
- Familial association with anxiety disorder
- Common defense mechanisms: isolation, avoidance, hypochondriasis

Avoidant Personality Disorder (0.5-1.6%)

Timid and socially awkward with a pervasive sense of inadequacy and fear of criticism. Fear of embarrassing or humiliating themselves in social situations so remain withdrawn and socially inhibited

Diagnosis requires 4+ of: **CRINGES**

1. Criticism or rejection preoccupies thoughts in social situations
2. Restraint in relationships due to fear of being shamed
3. Inhibited in new relationships due to fear of inadequacy
4. Needs to be sure of being liked before engaging socially
5. Gets around occupational activities requiring interpersonal contact
6. Embarrassment prevents new activity or taking risks
7. Self-viewed as unappealing or inferior

Obsessive-Compulsive Personality Disorder (3-10%)

Preoccupation with orderliness, perfectionism, and mental and interpersonal control. Is inflexible, closed-off, and inefficient

Diagnosis requires 4+ of: **SCRIMPER**

1. Stubborn
2. Cannot discard worthless objects
3. Rule/detail obsessed (to point of activity lost)
4. Inflexible in matters of morality, ethics, values
5. Miserly
6. Perfectionistic
7. Excludes leisure due to devotion to work
8. Reluctant to delegate to others

Dependent Personality Disorder (1.6-6.7%)

Pervasive and excessive need to be taken care of, excessive fear of separation, clinging and submissive behaviours. Difficulty making everyday decisions. Useful to set regulated treatment schedule (regular, brief visits) and being firm about in between issues. Encourage patient to do more for themselves, engage in own problem-solving

Diagnosis requires 5 of: **RELIANCE**

1. Reassurance required for everyday decisions
2. Expressing disagreement difficult
3. Life responsibilities assumed by others
4. Initiating projects difficult (because no confidence)
5. Alone (feels helpless and uncomfortable when alone)
6. Nurturance (goes to excessive lengths to obtain)
7. Companionship sought urgently
8. Exaggerated fears of being left to care for self

Table 11. Key Differences Among Schizoid, Schizotypal, and Schizophrenia

	Schizoid	Schizotypal	Schizophrenia
Thought Form	Organized	Organized, but vague and circumstantial	Disorganized, tangential, loosening of associations
Thought Content	No psychosis	No psychosis, may have ideas of reference, paranoid ideation, odd beliefs and magical thinking	Psychosis, hallucinations
Relationships	Solitary, NO desire for social relationships	Lacks close relationships, INTERESTED in relationships but socially inept	Socially marginalized, but not by choice

OCPD vs. OCD

	OCPD	OCD
Ego-Syntonic or Ego-Dystonic	Ego-syntonic	Ego-dystonic
Thought Content	Obsessional thinking, no compulsions, strict routine and rigidity in day-to-day matters	Obsessions and compulsions, rituals

Consider speaking to children alone. Always consider child abuse. See Pediatrics, P14

Tips for the Child Interview

- Use language the child will understand (i.e. don't ask about feeling of worthlessness, ask about whether they feel like they're a bad kid)
- Children in some cultures are taught to be quiet and avoid eye contact with adults who are authority figures (do not mistake with depression)
- Use developmentally-appropriate questions (i.e. don't ask about lack of interest in activities, ask children whether they feel bored)

Safety
Suicide/depression

Child Psychiatry

Developmental Concepts

- **temperament:** innate psycho-physiological and behavioural characteristics of a child (e.g. emotionality, activity, and sociability); spectrum from "difficult" to "slow-to-warm-up" to "easy temperament"
- **parental fit:** the congruence between parenting style (authoritative, authoritarian, permissive) and child's temperament
- **attachment:** special relationship between child and primary caretaker(s); develops during first year, best predictor of a child's attachment style is their parent's attachment style
- **separation anxiety** (normal between 10-18 mo): separation from attachment figure results in distress

Table 12. Attachment Models

Parent/Caregiver	Attachment Type	Features in Child
Loving, consistently available, sensitive, and receptive	Secure	Freely explore and engage strangers well (as long as mother in close proximity), upset with caregiver departure, happy with return
Rejecting, unavailable psychologically, insensitive responses	Insecure (avoidant)	Ignore caregiver, show little emotion with arrival or departure, little exploration
Inconsistent, insensitive responses, role reversal	Insecure (ambivalent/resistant)	Clingy but inconsolable, often display anger or helplessness, little exploration
Frightening, dissociated, sexualized, or atypical Often history of trauma or loss	Disorganized	Simultaneous approach/avoidance and stress related straining behaviour

Mood Disorders

MAJOR DEPRESSIVE DISORDER

Epidemiology

- pre-pubertal 1-2% (no gender differences); post-pubertal 4-18% (F:M = 2:1)

Clinical Presentation

- see *Mood Disorders*, PS9
- only difference in diagnostic criteria is that irritable mood may replace depressed mood
- physical factors: insomnia (children), hypersomnia (adolescents), somatic complaints, substance abuse, decreased hygiene
- psychological factors: irritability, boredom, anhedonia, low self-esteem, deterioration in academic performance, social withdrawal, lack of motivation, listlessness
- comorbid diagnoses of anxiety, ADHD, ODD, conduct disorder, and eating disorders

Treatment

- majority never seek treatment
- individual (CBT, IPT)/family therapy and education, modified school program
- SSRIs (strongest evidence for fluoxetine 10-40mg/d)
- close follow-up on adolescents starting SSRIs to monitor for increased suicidal ideation or behaviour
- in severe depression, best evidence for combined pharmacotherapy and psychotherapy
- ECT: only in adolescents who have severe illness, psychotic features, catatonic features, persistently suicidal
- light therapy, self-help books

Prognosis

- prolonged episodes, up to 1-2 yr
- adolescent onset predicts chronic mood disorder; up to 2/3 will have another depressive episode within 5 yr
- complications
- negative impact on family and peer relationships
- school failure
- significantly increased risk of suicide attempt (10%) or completion (however, suicide risk low for pre-pubertal children)
- substance abuse

DISRUPTIVE MOOD DYSREGULATION DISORDER

Clinical Presentation

- severe, developmentally inappropriate, recurrent verbal or behavioural temper outbursts at least 3 times per wk
- mood is predominantly irritable or angry in between outbursts, as observable by others
- these symptoms occur before 10 y, have been occurring for 12 mo, with no more than 3 consecutive mo free from symptoms
- high rates of comorbidities; ADHD, ODD, anxiety disorders, depressive disorders

BIPOLAR DISORDER

Clinical Presentation

- see *Bipolar Disorder*, PS13
- mixed presentation and psychotic symptoms (hallucinations and delusions) more common in adolescent population than adult population
- unipolar depression may be an early sign of adult bipolar disorder
- ~30% of psychotic depressed adolescents receive a bipolar diagnosis within 2 yr of presentation
- associated with rapid onset of depression, psychomotor retardation, mood-congruent psychosis, affective illness in family, pharmacologically-induced mania

Treatment

- Pharmacotherapy: mood stabilizers and/or antipsychotics
- Psychotherapy: CBT, Family Focused Therapy

Anxiety Disorders

- lifetime prevalence 10-20%; F:M = 2:1

Clinical Presentation

- children and adolescents rarely vocalize their anxiety but instead demonstrate it through their behaviour
- school problems, recurrent physical symptoms (abdominal pain, headaches) especially in mornings, social and relationship problems, social withdrawal and isolation, family conflict, difficulty with sleep initiation, irritability and mood symptoms, alcohol and drug use in adolescent

Differential Diagnosis

- clinical judgment important to differentiate developmentally normal from pathological anxiety
- for school avoidance, differentiate fear of general performance, humiliation, worry about separation and rule out bullying and school refusal due to learning disorder
- depressive disorders, ODD, truancy

Course and Prognosis

- better prognosis with later age of onset, lower co-morbidities, early initiation of treatment, ability to maintain school attendance and peer relationships, absence of social anxiety disorder
- with treatment up to 80% of children will not meet criteria for their anxiety disorder at 3 year follow-up but up to 30% will meet criteria for another psychiatric disorder

Treatment

- similar principles for most childhood anxiety disorders due to overlapping symptomatology and frequent comorbidity
- family psychotherapy, predictive and supportive environment
- CBT: child and parental education, relaxation techniques (e.g. deep breathing), exposure/desensitization, recognizing and correcting anxious thoughts
- pharmacotherapy: SSRIs (e.g. fluoxetine, paroxetine), benzodiazepines (alprazolam, clonazepam have evidence – use with caution due to addictive and abuse potential as well as disinhibiting effect, especially in neurodevelopmental delay)
 - fluvoxamine and sertraline also have good evidence, particularly for OCD

SEPARATION ANXIETY DISORDER

- excessive and developmentally inappropriate anxiety on real, threatened or imagined separation from primary caregiver or home with physical or emotional distress for at least 4 wk
- school refusal (75%)
- persistent worry, refusal to sleep alone, clinging, nightmares involving separation, somatic symptoms
- comorbid major depression common (2/3)
- worry about something happening to parent or themselves if separated

SOCIAL PHOBIA (SOCIAL ANXIETY DISORDER)

- situations in which the child feels they are exposed to scrutiny by others can provoke anxiety and become feared or avoided
- must distinguish between shy child, child with issues functioning socially (e.g. autism), and child with social anxiety
 - diagnosis only if anxiety interferes significantly with daily routine, social life, academic functioning or if markedly distressed. Must occur in settings with peers, not just adults
- features: temper tantrums, freezing, clinging behaviour, mutism, excessively timid, stays on periphery, refuses to be involved in group play
- significant implication for future quality of life if untreated; lower levels of satisfaction in leisure activities, higher rates of school dropout, poor workplace performance, increased rates of remaining single

SELECTIVE MUTISM

- consistent failure to speak in specific social situations in which there is an expectation for speaking despite speaking in other situations
- the disturbance interferes with educational or occupational achievement or with social communication

GENERALIZED ANXIETY DISORDER

- diagnostic criteria same as adults (see *Generalized Anxiety Disorder*, PS16)
 - **note:** only 1 item is required in children for Criteria C
- often redo tasks, show dissatisfaction with their work, and tend to be perfectionistic
- often fearful in multiple settings and expect more negative outcomes when faced with academic or social challenges, and require reassurance and support to take on new tasks

SPECIFIC PHOBIA

- common phobias in childhood include a fear of heights, small animals, doctors, dentists, darkness, loud noises, thunder and lightning

Attachment type can be assessed in infants 10-18 mo of age using the Strange Situation test, in which the child is stressed by the caregiver being removed from the situation and the stranger staying. Attachment style is measured by the child's behaviour during the reunion with the caregiver

Attachment problems may present as a child who is difficult to soothe, has difficulty sleeping, problems feeding, tantrums or behavioural problems

The shy child is quiet and reluctant to participate but slowly 'warms up'

Fluoxetine, Cognitive-Behavioural Therapy and Their Combination for Adolescents with Depression: Treatment for Adolescents with Depression Study (TADS) Randomized Controlled Trial

JAMA 2004;292:807-820

Study: Randomized controlled trial at 13 US academic and community clinics between spring 2000-summer 2003.

Patients: 439 patients ages 12-17 with a primary DSM IV diagnosis of major depressive disorder.

Outcomes: Children's Depression Rating Scale-Revised (CDRSR) total score.

Interventions: 12 wk of (1) fluoxetine (10-40 mg/d), (2) CBT, (3) CBT + fluoxetine (10-40 mg/d), or (4) placebo.

Results: Fluoxetine with CBT had a statistically significant CDRSR score as compared to placebo ($p=0.001$) with a 71% response rate. This combination was greater than fluoxetine alone ($p=0.02$), and CBT alone ($p=0.01$). Fluoxetine alone was greater than CBT alone ($p=0.01$).

Newer Generation Antidepressants for Depressive Disorders in Children and Adolescents

Cochrane DB Syst Rev 2012;11:CD004851

Study: Meta-analysis of 19 trials containing 3,335 participants (including RCTs, cross-over trials, and cluster trials).

Population: Children and adolescents aged 6-18 yr with diagnosed depressive disorder.

Interventions: Antidepressants, placebo.

Main Outcome Measure: Depression severity score.

Results: Children treated with an antidepressant had lower depression severity score and higher rates of response/remission. Children on antidepressants were also found to be at increased risk (58%) of suicide-related outcome (RR 1.58; 95% CI 1.02-2.45).

Conclusions: In children and adolescents, antidepressants are effective at treating depression, yet may cause a higher chance of suicide-related outcomes.

Neurodevelopmental Disorders

Autism Spectrum Disorder

Diagnosis

- persistent deficits in social communication and interaction, manifested in three areas
 - social-emotional reciprocity, ranging, for example, from abnormal social approach and failure of normal back-and-forth conversation, to reduced sharing of interests, emotions, or affect, to failure to initiate or respond to social interactions
 - nonverbal communicative behaviours, ranging, for example, from poorly integrated verbal and nonverbal communication, to abnormalities in eye contact and body language or deficits in understanding and use of gestures, to a total lack of facial expressions and nonverbal communication
 - developing, maintaining, and understanding relationships, ranging, for example, from difficulties adjusting behaviour to suit various social contexts, to difficulties in sharing imaginative play or in making friends, to absence of interest in peers
- restricted, repetitive patterns of behaviour, interests, or activities. Two or more of: stereotyped or repetitive motor movements, insistence on sameness, highly restricted fixated interests, hyper-/hypo-reactivity to sensory input
- symptoms must be present in early developmental period
- symptoms cause clinically significant impairment in social, occupational, or other important areas of current functioning
- not better explained by intellectual disability or global developmental delay

- **specifiers**

- current severity: requiring very substantial support, requiring substantial support, requiring support
- with or without accompanying language impairment
- with or without accompanying intellectual impairment
- associated with known medical or genetic condition or environmental factors (i.e. Rett's disorder)

Differential Diagnosis

- developmental disability, childhood schizophrenia, social phobia, OCD, communication disorder, non-verbal learning disorder, ADHD, abuse, hearing or visual impairment, seizure disorder, motor impairment

Management

- hearing and vision test to rule out impairment
- psychological testing to assess intellectual functioning and learning
- chromosomal analysis to rule out abnormalities (e.g. Trisomy 21, Fragile X syndrome)
- rule out psychotic disorders, social problems, depression, anxiety, abuse

Treatment

- team-based: school, psychologist, occupational therapist, physiotherapist, speech and language therapy, pediatrics, psychiatry
- psychosocial: family education and support, school programming, behaviour management, social skills training
- treat concomitant disorders such as ADHD, tics, OCD, anxiety, depression, and seizure disorder
- pharmacotherapy: atypical antipsychotics (for irritability, aggression, agitation, self-mutilation, tics), SSRIs (for anxiety, depression), stimulants (for associated inattention and hyperactivity)

Prognosis

- variable, but improves with early intervention
- better if IQ >60 and able to communicate

Attention Deficit Hyperactivity Disorder

- prevalence: 5-12% of school-aged children; M:F = 4:1, although girls may be under-diagnosed
- girls tend to have inattentive/distractible symptoms; boys have impulsive/hyperactive symptoms

Etiology

- genetic: 75% heritability, dopamine candidate genes DAT1, DRD4
- neurobiology: decreased catecholamine transmission, low prefrontal cortex (PFC) activity, increased beta activity on EEG
- cognitive: developmental disability, poor inhibitory control and other errors of executive function

Diagnosis

- differential: learning disorders, hearing/visual defects, thyroid, atopic conditions, congenital problems (fetal alcohol syndrome, Fragile X), lead poisoning, history of head injury, traumatic life events (abuse)
- diagnosis (3 subtypes)
 - **combined type**: 6 or more symptoms of inattention and 6 or more symptoms of hyperactivity-impulsivity
 - **predominantly inattentive type**: 6 or more symptoms of inattention
 - **predominantly hyperactive-impulsive type**: 6 or more symptoms of hyperactivity-impulsivity
 - for older adolescents (>17 yr) or adults, 5 symptoms required
 - symptoms persist for >6 mo
 - onset before age 12
 - symptoms present in at least two settings (i.e. home, school, work)
 - interferes with academic, family, and social functioning
 - does not occur exclusively during the course of another psychiatric disorder

Observe child for "ATTENTION" features

Annoying
Temperamental
Energetic
Noisy
Task incompletion
Inattentive
Oppositional
Negativism

Table 13. Core Symptoms of ADHD (DSM-5)

Inattention	Hyperactivity	Impulsivity
Careless mistakes	Fidgets, squirms in seat	Blurts out answers before questions completed
Cannot sustain attention in tasks or play	Leaves seat when expected to remain seated	Difficulty awaiting turn
Does not listen when spoken to directly	Runs and climbs excessively	Interrupts/intrudes on others
Fails to complete tasks	Cannot play quietly	
Disorganized	"On the go", driven by a motor	
Avoids, dislikes tasks that require sustained mental effort	Talks excessively	
Loses things necessary for tasks or activities		
Distractible		
Forgetful		

Features

- difficult to differentiate from highly variable normative behaviour before age 4
- often identified upon school entry
- rule out developmental delay, sensory impairments, genetic syndromes, encephalopathies or toxins (alcohol, lead)
- risk of substance abuse, depression, anxiety, academic failure, poor social skills, risk of comorbid CD and/or ODD, risk of adult ASPD
- associated with family history of ADHD, difficult temperamental characteristics

Treatment

- non-pharmacological: parent management, anger control strategies, positive reinforcement, social skills training, individual/family therapy, behaviour therapy, tutors, classroom intervention, exercise routines, extracurricular activities, omega-3 fatty acids
- pharmacological
- first line: stimulants (methylphenidate, amphetamine salts)
- second line: atomoxetine
- third line/adjunct: nonstimulants (α -agonists; clonidine, guanfacine, NDRI; bupropion)
- for comorbid symptoms: antidepressants, antipsychotics

Prognosis

- 70-80% continue into adolescence, but hyperactive symptoms usually abate
- 65% continue into adulthood; secondary personality disorders and compensatory anxiety disorders are identifiable

Treatment with stimulant medications of ADHD in childhood actually decreases the likelihood of substance abuse later in life, contrary to the concerns of many parents and health care providers

A Systematic Review and Analysis of Long-Term Outcomes in Attention Deficit Hyperactivity Disorder: Effects of Treatment and Non-Treatment

BMC Med 2012;10:99

Study: Systematic review of 351 studies.

Purpose: To determine the long-term outcomes of ADHD and whether there is an effect on long-term outcomes with treatment.

Population: Patients with diagnosed or symptomatic presentation of ADHD.

Interventions: No treatment (control), treatment (pharmacological, non-pharmacological, and multi-modal).

Outcome Groups: Drug use/addictive behaviour, academic outcomes, antisocial behaviour, social function, occupation, self-esteem, driving outcomes, services use, obesity.

Results: Untreated participants with ADHD had poorer outcomes vs. non-ADHD participants in 74% (n=244) of studies, while 26% (n=89) showed similar outcomes. 72% (n=37) of studies showed a benefit from ADHD treatment vs. untreated ADHD and 28% (n=15) showed no benefit. Treatment of ADHD was found to be beneficial in studies looking at driving (100%), obesity (100%), self-esteem (90%), social function (83%), academic outcomes (71%), drug use/addictive behaviour (67%), antisocial behaviour (50%), and occupation (33%).

Conclusions: Overall, people with ADHD have poorer long-term outcomes than controls (those without ADHD). For those with ADHD, treatment improves long-term outcomes.

Disruptive, Impulse Control, and Conduct Disorder

Oppositional Defiant Disorder

- prevalence: 2-16%, M=F after puberty

Diagnosis

- pattern of negativistic/hostile and defiant behaviour for ≥ 6 mo with ≥ 4 of
 - **angry/irritable mood:** easily loses temper, touchy or easily annoyed, often angry and resentful
 - **argumentative/defiant:** argues with adults/authority figure, defies requests/rules, deliberately annoys, blames others for their own mistakes or misbehaviour
 - **vindictiveness:** spiteful or vindictive twice in past 6 mo
- behaviour causes significant impairment in social, academic, or occupational functioning
- behaviours do not occur exclusively during the course of a psychotic or mood disorder
- criteria not met for conduct disorder (CD); if 18 yr or older, criteria not met for ASPD
- may progress to CD, differentiated by an absence of destructive or physically aggressive behaviour
- features that typically differentiate ODD from transient developmental stage: onset <8 yr, chronic duration (>6 mo), frequent intrusive behaviour
- impact of ODD: poor school performance, few friends, strained parent/child relationships, risk of later mood disorders

Treatment

- parent: management training, psychoeducation and family therapy to reduce punitive parenting and parent-child conflict
- behavioural therapy: to teach, practice and reinforce prosocial behaviour
- social: school/day-care interventions
- pharmacotherapy for comorbid disorders

ODD kids "ARE BRATS"

Annoying
Resentful
Easily annoyed
Blames others
Rule breaker
Argues with adults
Temper
Spiteful/vindictive

Conduct Disorder

- prevalence: 1.5-3.4% (M:F = 4-12:1)

Etiology

- parental/familial factors: parental psychopathology (e.g. ASPD, substance abuse), child-rearing practices (e.g. child abuse, discipline), low socioeconomic status (SES), family violence
- child factors: difficult temperament, ODD, learning problems, neurobiology

Diagnosis

- differential: ADHD, depression, head injury, substance abuse
- diagnosis: use multiple sources (Achenbach Child Behavioural Checklist, Teacher's Report Form)
 - pattern of behaviour that violates rights of others and age appropriate social norms with ≥ 3 criteria noted in past 12 mo and ≥ 1 in past 6 mo
 - ♦ aggression to people and animals: bullying, initiating physical fights, use of weapons, forced sex, cruel to people, cruel to animals, stolen while confronting a person (e.g. armed robbery)
 - ♦ destruction of property: firesetting with intent to damage, deliberately destroying others' property
 - ♦ deceitfulness or theft: breaking and entering, conning others, stealing nontrivial items without confrontation
 - ♦ violation of rules: out all night before age 13, often truant from school before age 13, runaway ≥ 2 times at least overnight or for long periods of time
 - disturbance causes clinically significant impairment in social, academic, or occupational functioning
 - if individual is 18 yr or older, criteria not met for ASPD
- diagnostic types
 - childhood onset: at least one criterion prior to age 10
 - ♦ poor prognosis: associated with ODD, aggressiveness, impulsiveness
 - adolescent onset: absence of any criteria until age 10
 - ♦ better prognosis; least aggressive, gang-related delinquency
 - mild, moderate, severe

Treatment

- early intervention necessary and more effective; long-term follow-up required
- psychosocial: parent management training, anger replacement training, CBT, family therapy, education/employment programs, social skills training,
- pharmacotherapy: for comorbid disorders

Prognosis

- poor prognostic indicators include early-age onset, high frequency, variety of behaviours, pervasiveness (i.e. in home, school, community), comorbid ADHD, early sexual activity, substance abuse
- 50% of CD children become adult ASPD

Conduct Disorder Diagnosis

TRAP

Theft: breaking and entering, deceiving, non-confrontational stealing

Rule breaking: running away, skipping school, out late

Aggression: people, animals, weapons, forced sex

Property destruction

Intermittent Explosive Disorder

Diagnosis

- recurrent behavioural outbursts representing a failure to control aggressive impulses in children > 6 yr, manifested as either
 - verbal or physical aggression that does not damage others or property, occurring 2+ times per wk for 3 mo
 - 3 outbursts involving physical damage to another person, animal or piece of property in the last 12 mo
- outbursts are out of proportion to triggers or provocation, are not premeditated, and not for primary gain
- outbursts cause clinically significant impairment in social, academic, or occupational functioning

See Pediatrics

- Child Abuse, P14
- Chronic Abdominal Pain, P40
- Developmental Delay, P22
- Intellectual Disability, P23
- Learning Disabilities, P24
- Sleep Disturbances, P13

See Neurology

- Tic Disorders, N34
- Tourette's Syndrome, N35

Psychotherapy

- treatment in which a person with mental or physical difficulties aims to achieve symptomatic relief through talks with another person
- psychotherapy is delivered by a specially trained social worker, nurse, psychologist, psychiatrist, counselor or general practitioner
- various types of therapy exist because of diverse theories of human psychology and mental illness etiology

Common Factors of Psychotherapy

- good evidence that effective psychotherapy creates observable changes in brain circuitry and connectivity, similar to those observed with successful pharmacologic and other treatment modalities
- studies suggest that up to 30-70% of therapy outcome is due to common factors with only 10-40% from specific factors
- common factors are: warmth (unconditional positive regard), accurate empathy, genuineness, goodness of fit

Freudian Psyche

id: instinctual drives, unconscious
superego: person's conscience, formed by societal/parental norms
ego: latin "I", sense of self, conscious actions, attempts to satisfy drives of id within confines of reality and demands of superego

Table 14. Summary of Psychotherapeutic Modalities

Type	Indications	Approach, Technique and Theory	Ideal Candidates	Duration
Psychoanalytic/psychodynamic	Psychoneuroses; anxiety, obsessional thinking, compulsive or conversion disorders, sexual dysfunction, depressive states	Theory: Exploration of meaning of early experiences and how they affect emotions and patterns of behaviour Recollection (remembering), repetition (reliving with the analyst), working through (gaining insight) Techniques: free association, dream interpretation, transference analysis	Psychologically minded, highly motivated, wish to understand selves and not just relieve symptoms Able to withstand difficult emotions without fleeing or self-destructive acts High level of function	Time intensive: -Classically: 4-5 times/wk for 3-7 yr Psychodynamically oriented therapy: 2-3 times/wk for fewer years
Supportive	Adjustment disorders, psychosomatic disorders, severe psychotic or personality disorders	Ameliorate symptoms through behavioural or environmental restructuring to aid adaptation and facilitate coping Help patients feel safe, secure and encouraged	Individuals in crisis or with severe symptoms in acute or chronic settings Low insight, low motivation, "weak" ego systems	Variable (single session to years, though often short-intermittent)
Interpersonal	Mood disorders, bulimia nervosa	Focuses on how interpersonal relationships impact symptoms 4 key problem areas addressed: grief and loss, role transitions, conflict, interpersonal deficits Break the interpersonal cycle: depression, self-esteem, social withdrawal	Individuals with depression or bipolar disorder with some insight and difficult social functioning Absence of severe psychotic process, personality disorder or comorbid substance abuse	12-20 wk
Behavioural	Most mental health disorders benefit from specific application of behavioural therapy (e.g. behavioural activation for depression; exposure therapy for phobias; contingency management for anorexia nervosa, substance use disorder)	Systematic Desensitization: mastering anxiety-provoking situations by approaching them gradually and in a relaxed state that limits anxiety Flooding: confronting feared stimulus for prolonged periods until it is no longer frightening Positive Reinforcement: strengthening behaviour and causing it to occur more frequently by rewarding it Negative Reinforcement: causing behaviour to occur more frequently by removing a noxious stimulus when desired behaviour occurs Extinction: causing a behaviour to diminish by not rewarding it Punishment (aversion therapy): causing a behaviour to diminish by applying a noxious stimulus	Individuals with motivation to change and specific symptoms that are amenable to change Global areas of dysfunction such as personality disorder are difficult to treat with behavioural therapy	Usually short term (weeks-months)
Cognitive Therapy	Depression, anxiety, panic disorder, personality disorders, and somatoform disorders	Moods/emotions are influenced by one's thoughts and psychiatric disturbances are often caused by habitual errors in thinking With therapy, help patient make explicit their inaccurate automatic thoughts and correct assumptions with a more balanced perspective Uses thought records (often charts with column headings including "situation," "feeling," "thought," "cognitive distortion") to help monitor thoughts, the situations they occur in, and the feelings they might provoke due to their underlying cognitive errors	Motivated patients who will comply with homework, openness to changing core beliefs	First course - usually 15 - 25 weeks Maintenance therapy can be carried out over years

Table 14. Summary of Psychotherapeutic Modalities (continued)

Type	Indications	Approach, Technique and Theory	Ideal Candidates	Duration
Cognitive Behavioural Therapy	Most mental health disorders including: mood, anxiety, OCD, personality, eating, substance use, psychotic disorders	Combines theory and method from Cognitive and Behavioural therapies to teach the patient to change connections between thinking patterns, habitual behaviours and mood/anxiety problems	Individuals with motivation to change and are able to participate in homework	Typically 6-18, 1hr sessions Maintenance sessions can be added over time
Dialectical Behavioural Therapy	Borderline Personality Disorder	Therapy that combines CBT techniques with Buddhist Zen mindfulness practices and dialectical philosophy Focuses on 4 types of skills: mindfulness, emotion regulation, interpersonal effectiveness, and distress tolerance Involves 4 components: individual therapy, group skills training, phone consultations, and a consultation team	Patients with severe problems of emotional dysregulation, impulsivity, and self-harm Patients with borderline personality disorder or borderline personality traits	Typically 1 yr
Motivational Interviewing	Substance use disorders Techniques can be applied to facilitate behavioural change in most psychological problems	Spirit of MI (CAPE): Compassion, Acceptance, Partnership, Evocation Principles of MI (RULE): Resist "righting reflex", Understand client and their reasons for change, Listen, Empower by conveying hope and supporting autonomy Techniques of MI (OARS): Open-ended questions, Affirmations to validate client, Reflections (the skill of accurate empathy), Summaries to help client organize self	Patients with problematic substance use, maladaptive behaviour patterns (therapy disengagement, medication noncompliance, poor health habits)	Brief interventions (efficacy with as little as 15 min, single sessions), better result with more sessions. Addiction is a chronic condition, often need boosters over time
Motivational Enhancement Therapy (MET)				MET = 4 sessions

Two Year Randomized Controlled Trial and Follow-Up of Dialectical Behaviour Therapy vs. Therapy by Experts for Suicidal Behaviours and Borderline Personality Disorder

Arch Gen Psychiatry 2006;63:757-66

Objective: To determine how DBT compares with non-behavioural psychotherapy.

Study: One year randomized controlled trial followed by one year follow-up period.

Patients: 100 women with recent suicidal and self-injurious behaviours meeting DSM criteria and matched to various demographic data.

Intervention: One year of DBT or one year of non-behavioural therapy.

Outcomes: Trimester assessments of suicidal behaviour, emergency services use, general psychological well-being.

Results: Patients receiving DBT were half as likely to attempt suicide, required less hospitalization for suicidal ideation, had lower medical risk for suicide attempts, were less likely to drop out of therapy and had fewer emergency room visits for suicidal ideation.

Conclusions: DBT is effective in reducing suicidal behaviour in patients with borderline personality disorder.

Other Therapies

- **group psychotherapy**
 - aims to promote self-understanding, acceptance, social skills
- **family therapy**
 - family system considered more influential than individual especially for children
 - focus on here and now, re-establishing parental authority, strengthening normal boundaries, and rearranging alliances
- **narrative psychotherapy**
- an integrative approach that attempts to understand the patients experience as a whole
- **hypnosis:** mixed evidence for the treatment of pain, phobias, anxiety, and smoking cessation
 - mindfulness-based cognitive therapy(MBCT)/stress reduction(MBSR): derived from Buddhist meditative and philosophical practices; aims to help people attend to thoughts, behaviours and emotions non-judgmentally and in the moment using guided breathing exercises emerging evidence for adjustment disorder, MDD, anxiety, pain disorders, insomnia, substance relapse prevention

Pharmacotherapy

Antipsychotics

- "antipsychotics" and "neuroleptics" are terms used interchangeably
- overall mechanism of action: block, to varying degrees, dopamine activity in target brain pathways (see sidebar)
- indications: for calm, sleep, psychosis and mania reduction, mood stabilizing - used in schizophrenia and other psychotic disorders, mood disorders with or without psychosis, violent behaviour, autism, Tourette's, somatoform disorders, dementia, OCD
- onset: immediate calming effect and decrease in agitation; thought disorder responds in 2-4 wk
- rational use
 - no reason to combine antipsychotics
 - choosing an antipsychotic
 - ♦ all antipsychotics are equally effective, except for clozapine (considered to be most effective in treatment-refractory psychosis)
 - ♦ atypical antipsychotics (SGA) are as effective as typical (first generation) antipsychotics but are thought to have better side effect profiles
 - ♦ choose a drug that the patient has responded to in the past or that was used successfully in a family member
- route: PO, short-acting or long-acting depot IM injections, sublingual
- if no response in 4-6 weeks, switch drugs; if response, titrate dose
- duration: minimum 6 mo, usually for life

Dopamine Pathways Affected by Antipsychotics

Pathway	Effects	Associated Pathology
Mesolimbic	Emotion origination, reward	HIGH dopamine causes positive symptoms of schizophrenia (delusions, hallucinations)
Mesocortical	Cognition, executive function	LOW dopamine causes negative symptoms of schizophrenia
Nigrostriatal	Movement	LOW dopamine causes EPS
Tuberoinfundibular	Prolactin hormone release	LOW dopamine causes hyperprolactinemia

Long-Acting Preparations

- antipsychotics formulated in oil for IM injection (see Table 15)
- received on an outpatient basis
- indications: individuals with schizophrenia or other chronic psychosis who relapse because of non-adherence
- dosing: start at low dosages, then titrate every 2 to 4 wk to maximize safety and minimize side effects
- should be exposed to oral form prior to first injection
- side effects: risk of EPS, parkinsonism, increased risk of NMS

Canadian Guidelines for the Treatment of Acute Psychosis in the Emergency Setting

- haloperidol 5 mg IM (or loxapine 25 mg) ± lorazepam 2 mg IM
- olanzapine 2.5-10 mg (PO, IM, quick dissolve)
- risperidone 2 mg (M-tab, liquid)

Table 15. Common Antipsychotic Agents

	Starting Dose	Maintenance	Maximum	Relative Potency (mg)
Typicals (in order of potency from high to low)				
Haloperidol (Haldol®)	2.5 mg IM q4-8h 0.5-5 mg PO b/tid 0.2 mg/kg/d PO	Based on clinical effect	20 mg/d PO	2
Fluphenazine enanthate (Moditen®, Modecate® for IM formulation)	2.5-10 mg/d PO	1-5 mg PO qhs 25 mg IM/SC q1-3wk	20 mg/d PO	2
Zuclopenthixol HCl (Clopixol®)	20-30 mg/d PO	20-40 mg/d PO	100 mg/d PO	4
Zuclopenthixol acetate (Acuphase®)	50-150 mg IM q48-72h		400 mg IM (q2wk)	
Zuclopenthixol decanoate (Cloxipol Depot®)	100 mg IM q1-4wk	150-300 mg IM q2wk	600 mg IM/wk	
Perphenazine (Trilafon®)	8-16 mg PO b/tid	4-8 mg PO t/qid	64 mg/d PO	10
Loxapine HCl (Loxitane®)	10 mg PO tid 12.5-50 mg IM q4-6h	60-100 mg/d PO	250 mg/d PO	10
Chlorpromazine (Largactil®)	10-25 mg PO b/t/qid	400 mg/d PO	1000 mg/d PO	100
Atypicals (in order of potency from high to low)				
Risperidone (Risperdal®, Risperdal Consta® for IM long acting preparation, Risperdal® M-Tab for melting form – placed on tongue)	1-2 mg OD/bid	4-8 mg/d PO 25 mg IM q2wk	8 mg/d PO	2
Paliperidone (Invega®)	3 mg/d PO	3-12 mg/d PO	12 mg/d PO	4
Olanzapine (Zyprexa®, Zyprexa Zydys® for melting form – placed on tongue, Zyprexa Intramuscular®)	5 mg/d PO	10-20 mg/d PO	30 mg/d PO	5
Asenapine (Saphris®)	5 mg SL bid	5-10 mg SL bid	10 mg bid	5
Ziprasidone (Zeldox®)	20 mg bid PO	40-80 mg bid PO	160 mg/d PO	6
Aripiprazole (Ablify®)	10-15 mg/d PO	10-15 mg/d PO	30 mg/d PO	7.5
Quetiapine (Seroquel®, Seroquel XR® for extended release®)	25 mg PO bid	400-800 mg/d PO	800 mg/d PO	75
Clozapine (Clozaril®)	25 mg PO bid	300-600 mg/d PO	600 mg/d PO	100

Typical (First Generation) vs. Atypical (Second Generation) Antipsychotics

	Typical	Atypical
Mechanism	Block postsynaptic dopamine receptors (D2)	Block postsynaptic dopamine receptors (D2) on presynaptic dopaminergic terminals, triggering dopamine release, and reversing dopamine blockade in some pathways
Pros	Inexpensive Plenty of injectable forms available	Fewer EPS Low risk of tardive syndromes Mood stabilizing effects
Cons	More EPS Tardive syndromes in long-term Not mood stabilizing	Expensive Few injectable forms available Metabolic side effects (weight gain, hyperglycemia, lipid abnormalities, metabolic syndrome) Exacerbation (or new onset) of obsessive behaviour

Effectiveness of Antipsychotic Drugs in Patients with Chronic Schizophrenia

NEJM 2005;353:1209-23

Study: Randomized, double-blind, active-control trial with median follow-up of 6 mo.

Patients: 1,432 patients with a diagnosis of schizophrenia (as per DSM-IV criteria) and able to take antipsychotic medications (as determined by study doctors). Mean age 41, 74% male, 26% female.

Intervention: 1-4 capsules daily of olanzapine (20.1 mg), quetiapine (543.4 mg), risperidone (3.9 mg), perphenazine (20.8 mg), or ziprasidone (112.8 mg), with dosage at the discretion of the study doctor. Mean modal doses in parentheses.

Main Outcome: Discontinuation of treatment for any cause.

Results: Olanzapine group had statistically significant lower rate of discontinuation for any cause (64%) from all others (quetiapine – 82%, risperidone – 74%, perphenazine – 75%, ziprasidone – 79%). There were no significant differences in time until discontinuation due to intolerable side effects; however, olanzapine was associated with a significantly higher rate of metabolic side effects.

Table 16. Commonly Used Atypical Antipsychotics

	Risperidone (Risperdal®)	Olanzapine (Zyprexa®, Zydys®)	Quetiapine (Seroquel®)	Clozapine (Clozaril®)	Aripiprazole (Abilify®)
Advantages	Lower incidence of EPS than typical antipsychotics at lower doses (<8 mg) Associated with less weight gain compared to clozapine and olanzapine	Better overall efficacy compared to haloperidol Well tolerated Low incidence of EPS and TD	Associated with less weight gain compared to clozapine and olanzapine Mood stabilizing	Most effective for treatment-resistant schizophrenia Does not worsen tardive symptoms; may treat them Approximately 50% of patients benefit, especially paranoid patients and those with onset after 20 yr	Less weight gain and risk of metabolic syndrome compared to olanzapine and a lower incidence of EPS compared to haloperidol
Disadvantages	SE: insomnia, agitation, EPS, H/A, anxiety, prolactin, postural hypotension, constipation, dizziness, weight gain Highest risk of EPS among atypicals (still lower than high-potency typicals)	SE: mild sedation, insomnia, dizziness, minimal anticholinergic, early AST and ALT elevation, restlessness High risk of metabolic effects (weight gain, DM, hyperlipidemia)	SE: H/A, sedation, dizziness, constipation Most sedating of first line atypicals	SE: drowsiness/sedation, hypersalivation, tachycardia, dizziness, EPS, NMS 1% agranulocytosis	SE: H/A, agitation, anxiety, insomnia, weight gain, decreased serum prolactin levels
Comments	Quick dissolve (M-tabs), and long-acting (Consta®) formulations available	Quick dissolve formulation (Zydys®) used commonly in ER setting for better compliance IM form available		Weekly blood counts for at least 1 mo, then q2wk Do not use with drugs which may cause bone marrow suppression due to risk of agranulocytosis	

Note: Risk of weight gain: Clozapine > Olanzapine > Quetiapine > Risperidone

Table 17. Side Effects of Antipsychotics

System	Side Effects
Anticholinergic	Dry mouth, urinary retention, constipation, blurred vision, toxic-confusional states
α-adrenergic Blockade	Orthostatic hypotension, impotence, failure to ejaculate
Dopaminergic Blockade	Extrapyramidal syndromes, galactorrhea, amenorrhea, impotence, weight gain
Anti-histamine	Sedation
Hematologic	Agranulocytosis (clozapine)
Hypersensitivity Reactions	Liver dysfunction, blood dyscrasias, skin rashes, neuroleptic malignant syndrome, altered temperature regulation (hypothermia or hyperthermia)
Endocrine	Metabolic syndrome

Neuroleptic Malignant Syndrome

- **psychiatric emergency**
 - due to massive dopamine blockade; increased incidence with high potency and depot neuroleptics
- **risk factors**
 - medication factors: sudden increase in dosage, starting a new drug
 - patient factors: medical illness, dehydration, exhaustion, poor nutrition, external heat load, male, young adults
- **clinical presentation**
 - mental status changes (usually occur first), fever, autonomic reactivity, rigidity
 - develops over 24-72 h
 - labs: increased creatine phosphokinase, leukocytosis, myoglobinuria
- **treatment:** supportive - discontinue drug, hydration, cooling blankets, dantrolene (hydrantoin derivative, used as a muscle relaxant), bromocriptine (DA agonist)
- **mortality:** 5%

Extrapyramidal Symptoms

- incidence related to increased dose and potency
- acute (early-onset; reversible) vs. tardive (late-onset; often irreversible)

Note: high potency antipsychotics (e.g. haloperidol) have low doses, while low potency antipsychotics (e.g. chlorpromazine) have high doses

Anticholinergic Effects

Red as a beet
Hot as a hare
Dry as a bone
Blind as a bat
Mad as a hatter

Metabolic and Cardiovascular Adverse Effects Associated with Antipsychotic Drugs

Nat Rev Endocrinol 2012;8:114-126

Study: Review.

Conclusions: All antipsychotics can cause cardiovascular and metabolic side effects, such as obesity, dyslipidemia, hyperglycemia and metabolic syndrome. Olanzapine and clozapine are most likely to cause these side effects. The mechanism that underlies the metabolic and cardiovascular effects is not fully understood, however, the histamine, dopamine, serotonin, and muscarinic receptors are implicated.

Features of Neuroleptic Malignant Syndrome

FARM

Fever

Autonomic changes (e.g. increased HR/BP, sweating)

Rigidity of muscles

Mental status changes (e.g. confusion)

FARM symptoms are also seen in SS

SS can be distinguished from NMS by the following:

SS	NMS
Twitchy, shivering, restless	Severe global rigidity
Flushed, sweaty	Pallor
Vomiting, diarrhea, abdominal pain	No GI symptoms

QT Prolongation is an important side effect of antipsychotics. ECGs should be obtained prior to initiating a new medication and to monitor side effects. Pearls:

Typicals - chlorpromazine and haloperidol warrant cardiac monitoring
Atypicals - ziprasidone has the highest risk among atypicals, clozapine also warrants monitoring

Table 18. Extrapyramidal Symptoms

	Dystonia	Akathisia	Pseudoparkinsonism	Dyskinesia
Acute or Tardive	Both	Both	Acute	Tardive
Risk Group	Acute: Young Asian and Black males	Elderly females	Elderly females	
Presentation	Sustained abnormal posture; torsions, twisting, contraction of muscle groups; muscle spasms (e.g. oculogyric crisis, laryngospasm, torticollis)	Motor restlessness; crawling sensation in legs relieved by walking; very distressing, increased risk of suicide and poor adherence	Tremor; rigidity (cogwheeling); akinesia; postural instability (decreased/absent arm-swing, stooped posture, shuffling gait, difficulty pivoting)	Purposeless, constant movements, involving facial and mouth musculature, or less commonly – the limbs
Onset	Acute: within 5 d Tardive: >90 d	Acute: within 10 d Tardive: >90 d	Acute: within 30 d	Tardive: >90 d
Treatment	Acute: benztropine or diphenhydramine	Acute: lorazepam, propranolol, or diphenhydramine; reduce or change neuroleptic to lower potency	Acute: benztropine (or benzodiazepine if side effects); reduce or change neuroleptic to lower potency	Tardive: no good treatment; may try clozapine; discontinue drug or reduce dose

Antiparkinsonian Agents (Anticholinergic Agents)

- types
 - benztropine (Cogentin®) 2 mg PO, IM or IV OD (~1-6 mg)
 - amantadine (Symmetrel®) 100 mg PO bid (100-400 mg)
 - diphenhydramine (Benadryl®) 25-50 mg PO/IM qid
- do not always prescribe with neuroleptics
 - give antiparkinsonian agents only if at high risk for acute EPS or if acute EPS develops
- do not give these for tardive syndromes because they worsen the condition

Antidepressants

- onset of effect
 - relief of neurovegetative (physical) symptoms: 1-3 wk
 - relief of emotional/cognitive symptoms: 2-6 wk
- taper TCAs slowly (over weeks-months) because they can cause withdrawal reactions
- tapering of any kind of antidepressant is usually required and based on the half-life of the medication and the patient's individual sensitivity (e.g. fluoxetine does not require a slow taper due to long half life)
- it is important to be particularly vigilant over the first 2 wk of therapy as neurovegetative symptoms may start to resolve while emotional and cognitive symptoms may not (patients may be particularly at risk for suicidal behaviour during this time; in children/adolescents, paroxetine and venlafaxine not prescribed for this reason, as increases restlessness and suicidal ideation)
- treatment of bipolar depression
 - monotherapy with antidepressants is not advisable as a switch from depression to mania can occur
 - patients with bipolar disorder should only be treated with an antidepressant if it is combined with a mood stabilizer or antipsychotic

Selective Serotonin Reuptake Inhibitors (SSRIs)

vs. Other Antidepressants for Depression

Cochrane DB Syst Rev 2004; Issue 3

This systematic review of 98 RCTs compared the efficacy of SSRIs with other kinds of antidepressants in the treatment of patients with depressive disorders.

Conclusions: There is no significant difference in the effectiveness of SSRIs vs. TCAs. Consider relative patient acceptability, toxicity, and cost when choosing.

How Long to Treat?

6-12 mo: if first or second episode
2 yr: if third episode, elderly, psychotic features, refractory depression, > 2 episodes in 5 yr

Table 19. Common Antidepressants

Class	Drug	Daily Starting Dose (mg)	Therapeutic Dose (mg)	Comments
SSRI	fluoxetine (Prozac®)	20	20-80	Useful for anxiety states, OCD, eating disorders, seasonal depression, typical and atypical depression
	fluvoxamine (Luvox®)	50-100	150-300	All SSRIs have similar effectiveness but consider side effect profiles and half-lives
	paroxetine (Paxil®)	10	20-60	Sertraline, citalopram, and escitalopram have the least drug-interactions and are sleep-wake neutral
	sertraline (Zoloft®)	50	50-200	Fluoxetine and paroxetine are the most activating drugs (recommend taking in the AM)
	citalopram (Celexa®)	20	20-40	Fluoxetine does not require a taper due to long half-life and is the most used in children as it has most evidence
	escitalopram (Cipralex®)	10	10-20	Fluvoxamine is sedating (should be taken in PM)
SNRI	venlafaxine (Effexor®)	37.5-75	75-225	Useful for depression, anxiety disorders
	duloxetine (Cymbalta®)	40	40-60	
NDRI	bupropion (Wellbutrin®)	100	300-450	Useful for depression, seasonal depression Causes less sexual dysfunction (may reverse effects of SSRIs/SNRIs), weight gain, and sedation Increased risk of seizures at higher doses Contraindicated with history of seizure, stroke brain tumour, brain injury, closed head injury Not recommended for anxiety disorder treatment because of stimulating effects Important to specify formulation, as available in IR, SR, XL (longest)
TCA (3° Amines)	amitriptyline (Elavil®)	75-100	150-300	Useful for OCD (clomipramine), melancholic depression
	imipramine (Tofranil®)	75-100	150-300	
TCA (2° Amines)	nortriptyline (Aventyl®)	75-100	75-150	
	desipramine (Norpramin®)	100-200	150-300	
MAOI	phenelzine (Nardil®)	45	60-90	Useful for moderate/severe depression that does not respond to SSRI, atypical depression
	tranylcypromine (Pamate®)	30	10-60	
RIMA	moclobemide (Manerix®)	300	300-600	Useful for depression unresponsive to other therapies
NASSA	mirtazapine (Remeron®)	15	15-45	Useful in depression with prominent features of insomnia, agitation, or cachexia

MAOI = monoamine oxidase inhibitors; NASSA = noradrenergic and specific serotonin antagonists; NDRI = norepinephrine and dopamine reuptake inhibitors;

RIMA = reversible inhibition of MAO-A; SNRI = serotonin and norepinephrine reuptake inhibitors; SSRI = selective serotonin reuptake inhibitors; TCA = tricyclic antidepressants

Treatment Approach for Depression

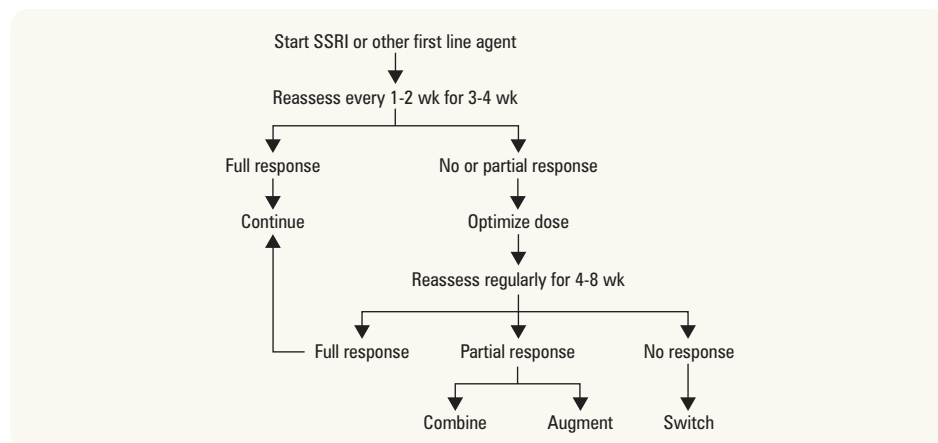

Figure 3. Treatment of depression

- **optimization:** ensuring adequate drug doses for the individual
- **augmentation:** the addition of a medication that is not considered an antidepressant to an antidepressant regimen (e.g. thyroid hormone, lithium, atypical antipsychotics [specifically: olanzapine, risperidone, aripiprazole])
- **combination:** the addition of another antidepressant to an existing treatment regimen (e.g. the addition of bupropion to an SSRI or SNRI)
- **substitute:** change in the primary antidepressant (within or outside a class)
- note: it is important to fully treat the symptoms of depression in order to decrease rates and severity of relapses

Table 20. Features of Commonly Used Antidepressant Classes

	SSRI	SNRI	TCA	MAOI
Examples	Fluoxetine, Sertraline, Citalopram	Venlafaxine, Duloxetine	Amitriptyline, Clomipramine	Phenelzine
Mode of Action	Block serotonin reuptake only	Block norepinephrine and serotonin reuptake	Block norepinephrine and serotonin reuptake	Irreversible inhibition of monoamine oxidase A and B Leads to ↑ norepinephrine and serotonin
Side Effects	Fewer than TCA, therefore increased compliance CNS: restlessness, tremor, insomnia, headache, drowsiness GI: N/V, diarrhea, abdominal cramps, weight loss Sexual dysfunction: impotence, anorgasmia CVS: increased HR, conduction delay, serotonin syndrome, EPS, SIADH	Low dose side effects include insomnia (serotonergic) Higher dose side effects include: tremors, tachycardia, sweating, insomnia, dose-dependent increase in diastolic BP (noradrenergic)	Anticholinergic effects: (see Table 17) Noradrenergic effects: tremors, tachycardia, sweating, insomnia, erectile and ejaculation problems α-1 adrenergic effects: orthostatic hypotension Antihistamine effects: sedation, weight gain CNS: sedation, stimulation, ↓ seizure threshold CVS: ↑ HR, conduction delay	Hypertensive crises with tyramine rich foods (e.g. wine, cheese), headache, flushes, palpitations, N/V, photophobia Dizziness, reflex tachycardia, postural hypotension, sedation, insomnia Weight gain Social dysfunction Energizing Minimal anticholinergic and antihistamine effects
Risk in Overdose	Relatively safe in OD	Tachycardia and N/V seen in acute overdose	Toxic in OD 3 times therapeutic dose is lethal Presentation: anticholinergic effects, CNS stimulation, then depression and seizures ECG: prolonged QT (duration reflects severity) Treatment: activated charcoal, cathartics, supportive treatment, IV diazepam for seizure, physostigmine salicylate for coma Do not give ipecac, as can cause rapid neurologic deterioration and seizures	Toxic in OD, but wider margin of safety than TCA
Drug Interactions	SSRIs inhibit P450 enzymes, therefore will affect levels of drugs metabolized by P450 system	MAOI, SSRI Does not seem to inhibit P450 system	MAOI, SSRI EtOH	EtOH Hypertensive crises with noradrenergic medications (e.g. TCA, decongestants, amphetamines) Serotonin syndrome with serotonergic drugs (e.g. SSRI, tryptophan, dextromethorphan)

Psychopharmacology of SSRIs

Post-Synaptic Serotonin Receptor Stimulated	Effect/Side Effect
5HT1A centrally	• Relief of depression • Anxiolytic effect
5HT2A in spinal cord	• Sexual dysfunction: delayed ejaculation, anorgasmia, decreased interest/libido
5HT2C/5HT2A in brain	• Activation: anxiety, insomnia • Worst with fluoxetine, paroxetine • Warn patients anxiety may worsen in first 1-2 wk of treatment
5HT3A in gut	• GI upset: nausea, vomiting, bloating • Take with food

Table 20. Features of Commonly Used Antidepressant Classes (continued)

	NDRI	RIMA	NASSA
Examples	Bupropion	Moclobemide	Mirtazapine
Mode of Action	Block norepinephrine and dopamine reuptake	Reversible inhibitor of monoamine oxidase A Leads to ↑ norepinephrine and serotonin	Enhance central noradrenergic and serotonergic activity by inhibiting presynaptic α-2 adrenergic receptors
Side Effects	CNS: dizziness, headache, tremor, insomnia CVS: dysrhythmia, HTN GI: dry mouth, N/V, constipation, ↓ appetite Other: agitation, anxiety, anaphylactoid reaction	CNS: dizziness, headache, tremor, insomnia CVS: dysrhythmia, hypotension GI: dry mouth, N/V, diarrhea, abdominal pain, dyspepsia GU: delayed ejaculation Other: diaphoresis	CNS: somnolence, dizziness, seizure (rare) Endocrine: ↑ cholesterol, ↑ triglycerides GI: constipation, ↑ ALT
Risk in Overdose	Tremors and seizures seen in acute overdose	Risk of fatal overdose when combined with citalopram or clomipramine	Mild symptoms with overdose
Drug Interactions	MAOI Drugs that reduce seizure threshold: antipsychotics, systemic steroids, quinolone antibiotics, antimalarial drugs	MAOI, SSRI, TCA Opioids	MAOI, SSRI, SNRI, RIMA

Serotonin Syndrome

- thought to be due to over-stimulation of the serotonergic system
- can result from medication combinations such as SSRI+MAOI, SSRI+tryptophan, MAOI+meperidine, MAOI+tryptophan
- rare but potentially life-threatening adverse reaction to SSRIs, especially when switching from an SSRI to an MAOI
- symptoms include nausea, diarrhea, palpitations, chills, restlessness, confusion, and lethargy but can progress to myoclonus, hyperthermia, rigor and hypertonicity
- treatment: discontinue medication and administer emergency medical care as needed
- important to distinguish from NMS

Discontinuation Syndrome

- caused by the abrupt cessation of an antidepressant
- observed most frequently with paroxetine, fluvoxamine, and venlafaxine (drugs with shortest half-lives)
- symptoms usually begin within 1-3 d and include: anxiety, insomnia, irritability, mood lability, N/V, dizziness, headache, dystonia, tremor, chills, fatigue, lethargy, and myalgia
- treatment: symptoms may last between 1-3 wk, but can be relieved within 24 h by restarting antidepressant therapy at the same dose the patient was taking and initiating a slow taper over several weeks
- consider using a drug with a longer half-life such as fluoxetine

Symptoms of Antidepressant Discontinuation

FINISH

- Flu-like symptoms
- Insomnia
- Nausea
- Imbalance
- Sensory disturbances
- Hyperarousal (anxiety/agitation)

Sequenced Treatment Alternatives to Relieve Depression

Journal of Psychosocial Nursing 2008;46:21-24

Study: Prospective randomized anti-depressant treatment trial.

Patients: 4,000 patients with major depressive disorder.

Objective: To compare the efficacy and tolerability of various antidepressant therapies through four sequential treatment levels.

Intervention: Level 1-citalopram → if relapse → Level 2-citalopram + bupropion SR, sertraline, venlafaxine XR, or cognitive psychotherapy. Level 2A-switch to bupropion or venlafaxine XR. Level 3-either mirtazapine or nortriptyline + lithium, T3. Level 4-tranylcypromine or venlafaxine XR + mirtazapine.

Results: Remission rates were 28% for Level 1, 17% for Level 2, 12-25% for Level 3, and 7-14% for Level 4. When more treatment steps are required, there are lower remission rates, greater degrees of tolerance, and higher rates of relapse.

Long-term lithium use can lead to a nephropathy and diabetes insipidus in some patients

Mood Stabilizers

General Prescribing Information

- **examples:** lithium, lamotrigine, divalproex, carbamazepine
- used in conjunction with atypical antipsychotics for managing episodes of bipolar disorder - depression, mania, stabilization
- vary in their ability to “treat” (reduce symptoms acutely) or “stabilize” (prevent relapse and recurrence) manic and depressive symptoms; multi-agent therapy is common
- before initiating, get baseline: CBC, ECG (if patient >45 yr old or cardiovascular risk), urinalysis, BUN, Cr, electrolytes, TSH
- before initiating lithium: screen for pregnancy, thyroid disease, seizure disorder, neurological, renal, cardiovascular diseases
- full effects not for 2-4 wks, thus may need acute coverage with benzodiazepines or antipsychotics

Specific Prescribing Information

- detailed pharmacological guidelines available online from the Canadian Network for Mood and Anxiety Treatments (CANMAT) and International Society for Bipolar Disorders (ISBD)
- for clinical information for treating bipolar disorder (see [Mood Disorders](#), PS9)

Table 21. Commonly Used Mood Stabilizers

	Lithium	Lamotrigine (Lamictal®)	Divalproex (Epival®)	Carbamazepine (Tegretol®)
Indications	1st line Acute mania (monotherapy or with adjunct SGA) Bipolar I depression (monotherapy or in combination with SSRI, divalproex, or bupropion) Bipolar disorder maintenance (monotherapy or with adjunct SGA) Other uses Bipolar II depression Augmentation of antidepressants in MDE and OCD Schizoaffective disorder Chronic aggression antisocial behaviour Recurrent depression	1st line: Bipolar I depression (monotherapy) Bipolar disorder maintenance (limited efficacy in preventing mania, more effective when combined with lithium) Other uses: Bipolar II depression Not recommended for: Acute mania as monotherapy	1st line Acute mania (monotherapy or with adjunct SGA) Bipolar I depression (combination with SSRI or lithium) Bipolar disorder maintenance (monotherapy or with adjunct SGA) Other uses Bipolar II depression Rapid cycling bipolar disorder Mixed phase/dysphoric mania	2nd line Acute mania (monotherapy) Bipolar disorder maintenance (monotherapy or in combination with lithium) Other uses Rapid cycling bipolar disorder
Mode of Action	Unknown Therapeutic response within 7-14 d	May inhibit 5-HT ₃ receptors May potentiate DA activity	Depresses synaptic transmission Raises seizure threshold	Depresses synaptic transmission Raises seizure threshold
Dosage	Adult: 600-1500 mg/d Geriatric: 150-600 mg/d Usually daily dosing	Starting: 12.5-15 mg/d Daily dose: 100-200 mg/d Dose adjusted in patients taking other anticonvulsants Note: very slow titration due to risk of Stevens-Johnson Syndrome	750-2500 mg/d Usually tid dosing	400-1600 mg/d Usually bid or tid dosing
Therapeutic Level	Adult: 0.8-1.0 mmol/L (1.0-1.25 mmol/L for acute mania) Geriatric: 0.5-0.8 mmol/L	Therapeutic plasma level not established Dosing based on therapeutic response	17-50 mmol/L	350-700 µmol/L
Monitoring	Monitor serum levels until therapeutic (always wait 12 h after dose) Then monitor biweekly or monthly until a steady state is reached, then q2mo Monitor thyroid function q6mo, creatinine q6mo, urinalysis q1yr	Monitor for suicidality, particularly when initiating treatment	LFTs weekly x 1 mo, then monthly, due to risk of liver dysfunction Watch for signs of liver dysfunction: nausea, edema, malaise	Weekly blood counts for first month, due to risk of agranulocytosis Watch for signs of blood dyscrasias: fever, rash, sore throat, easy bruising
Side Effects	GI: N/V, diarrhea, stomach pain GU: polyuria, polydipsia, GN, renal failure, nephrogenic DI CNS: fine tremor, lethargy, fatigue, headache Hematologic: reversible leukocytosis Other: teratogenic (Ebstein's anomaly), weight gain, edema, psoriasis, hypothyroidism, hair thinning, muscle weakness, ECG changes	GI: N/V, diarrhea CNS: ataxia, dizziness, diplopia, headache, somnolence Skin: rash (should discontinue drug because of risk of Stevens-Johnson syndrome), increased lamotrigine levels = increased risk of rash Other: anxiety	GI: liver dysfunction, N/V, diarrhea CNS: ataxia, drowsiness, tremor, sedation, cognitive blurring Other: hair loss, weight gain, transient thrombocytopenia, neural tube defects when used in pregnancy	GI: N/V, diarrhea, hepatic toxicity CNS: ataxia, dizziness, slurred speech, drowsiness, confusion, nystagmus, diplopia Hematologic: transient leukopenia (10%), agranulocytosis, aplastic anemia Skin: rash (5% risk; should discontinue drug because of risk of Stevens-Johnson syndrome) Other: neural tube defects when used in pregnancy
Interactions	NSAIDs decrease clearance		OCP	OCP

Lithium Toxicity

- clinical diagnosis as toxicity can occur at therapeutic levels
- common causes:** overdose, sodium/fluid loss, concurrent medical illness
- clinical presentation**
 - GI: severe nausea/vomiting and diarrhea
 - cerebellar: ataxia, slurred speech, lack of coordination
 - cerebral: drowsiness, myoclonus, tremor, upper motor neuron signs, seizures, delirium, coma
- management**
 - discontinue lithium for several doses and begin again at a lower dose when lithium level has fallen to a non-toxic range
 - serum lithium levels, BUN, electrolytes
 - saline infusion
 - hemodialysis if lithium >2 mmol/L, coma, shock, severe dehydration, failure to respond to treatment after 24 h, or deterioration

Anxiolytics

- anxiolytics mask or alleviate symptoms; they do not cure them
- **indications**
- short-term treatment of transient forms of anxiety disorders, insomnia, alcohol withdrawal (especially delirium tremens), barbiturate withdrawal, organic brain syndrome (acute agitation in delirium), EPS and akathisia due to antipsychotics, seizure disorders, musculoskeletal disorders
- **relative contraindications**
- major depression (except as an adjunct to other treatment), history of drug/alcohol abuse, caution in pregnancy/breastfeeding
- **mechanism of action**
- benzodiazepines: potentiate binding of GABA to its receptors; results in decreased neuronal activity
- buspirone: partial agonist of 5-HT_{1A} receptors

Benzodiazepines

- should be used for limited periods (weeks-months) to avoid dependence
- all benzodiazepines are sedating; be wary with use in the elderly
- have similar efficacy, so choice depends on half-life, metabolites and route of administration, OD or bid
- taper slowly over weeks-months because they can cause withdrawal reactions
 - low dose withdrawal: tachycardia, HTN, panic, insomnia, anxiety, impaired memory and concentration, perceptual disturbances
 - high dose withdrawal: hyperpyrexia, seizures, psychosis, death
- avoid alcohol because of potentiation of CNS depression; caution with drinking and driving/machinery use
- **side effects**
 - CNS: drowsiness, cognitive impairment, reduced motor coordination, memory impairment
 - physical dependence, tolerance
- **withdrawal**
 - symptoms: anxiety, insomnia, autonomic hyperactivity (less common)
 - onset: 1-2 d (short-acting), 2-4 d (long-acting)
 - duration: weeks-months
 - complications with above 50 mg diazepam/day: seizures, delirium, arrhythmias, psychosis
 - management: taper with long-acting benzodiazepine
 - similar to but less severe than alcohol withdrawal; can be fatal
- **overdose**
 - commonly used drug in overdose
 - ♦ overdose is rarely fatal
 - ♦ benzodiazepines are more dangerous and may cause death when combined with alcohol, other CNS depressants or TCAs

Benzodiazepine Antagonist – Flumazenil (Anexate®)

- use for suspected benzodiazepine overdose
- specific antagonist at the benzodiazepine receptor site

Buspirone (Buspar®)

- **primary use:** GAD
- may be preferred over benzodiazepines because are non-sedating, no interaction with alcohol, does not alter seizure threshold, not prone to abuse
- **onset of action:** 2 wk
- **side effects:** dizziness, drowsiness, nausea, headache, nervousness, EPS

Table 22. Common Anxiolytics

Class	Drug	Dose Range (mg/d)	t _{1/2} (h)	Appropriate Use
Benzodiazepines				
Long-acting	clonazepam (Rivotril®)	0.25-4	18-50	Akathisia, generalized anxiety, seizure prevention, panic disorder
	diazepam (Valium®)	2-40	30-100	Generalized anxiety, seizure prevention, muscle relaxant, alcohol withdrawal
	chlordiazepoxide (Librium®)	5-300	30-100	Sleep, anxiety, alcohol withdrawal
	flurazepam (Dalmane®)	15-30	50-160	Sleep
Short-acting	alprazolam (Xanax®)	0.25-4.0	6-20	Panic disorder, high dependency rate
	lorazepam (Ativan®)	0.5-6.0	10-20	Sleep, generalized anxiety, akathisia, alcohol withdrawal, sublingual available for very rapid action
	oxazepam (Serax®)	10-120	8-12	Sleep, generalized anxiety, alcohol withdrawal
	temazepam (Restoril®)	7.5-30	8-20	Sleep
	triazolam (Halcion®)	0.125-0.5	1.5-5	Shortest t _{1/2} , rapid sleep, but rebound insomnia
Azapirones				
	buspirone (Buspar®)	20-60	2-11	Generalized anxiety
	zopiclone (Imovane®)	5-7.5	3.8-6.5	Sleep

Geriatric Benzodiazepines

LOT

Lorazepam
Oxazepam
Temazepam

Safe in liver disease because not metabolized by liver

Benzodiazepines used for Alcohol Withdrawal

- Diazepam 20 mg PO/IV q1h prn
- Lorazepam 2-5 mg PO/IV/SL for patients with liver disease, chronic lung disease, or elderly

Somatic Therapies

Electroconvulsive Therapy

- various methodological improvements have been made since the first treatment in 1938 to reduce adverse effects
- modern ECT: induction of a generalized seizure using an electrical pulse through scalp electrodes while the patient is under general anesthesia with a muscle relaxant
- considerations: unilateral vs. bilateral electrode placement, pulse rate, dose, number and spacing of treatments
- usual course is 6-12 treatments, 2-3 treatments per wk
- **indications**
 - depression refractory to adequate pharmacological trial (MDD or Bipolar I depression)
 - high suicide risk
 - medical risk in addition to depression (dehydration, electrolytes, pregnancy)
 - previous good response to ECT
 - familial response to ECT
 - elderly
 - psychotic depression
 - catatonic features
 - marked vegetative features
 - acute schizophrenia unresponsive to medication
 - mania unresponsive to medications
 - OCD refractory to conventional treatment
- **side effects:** risk of anesthesia, memory loss (may be retrograde and/or anterograde, tends to resolve by 6-9 mo, permanent impairment controversial), headaches, myalgias
- unilateral ECT causes less memory loss than bilateral but may not be as effective
- **contraindications:** increased intracranial pressure, recent (< 2 wk) MI (not absolute but requires special monitoring)

Magnetic Seizure Therapy (MST)

- seizure induction by magnetic current induction rather than direct stimulation
- early studies demonstrate efficacy for depression as well as anxiety, reduced memory side effects vs. ECT

ECT in Society

Prior to the 1940's, ECT was performed without the use of muscle relaxants, resulting in seizures with full-scale convulsions and rare but serious complications such as vertebral and long-bone fractures. This practice may have led to negative societal perceptions of ECT, further perpetuated by barbaric depictions in popular culture. Despite ongoing stigmatization, ECT as it is practiced today is an effective and safe option for patients struggling with mental illness

Efficacy of ECT in Depression: A Meta-Analytic Review

J of ECT 2004; 20:13-20

Study: Meta-analysis of randomized and non-randomized control trials.

Patients: Individuals with unipolar and bipolar depression.

Methods: MEDLINE search for relevant papers from 1966-2003.

Main Outcomes: The Hamilton Depression Rating scale was used to determine response to treatment. **Results:** ECT was found to be superior to simulated ECT, placebo, TCAs, MAOIs, and anti-depressants in general.

Summary: ECT is an efficacious treatment modality, particularly in severe and treatment-resistant depression.

Repetitive Transcranial Magnetic Stimulation (rTMS)

- noninvasive production of focal electrical currents in select brain areas using magnetic induction
- **indications:** strong evidence for treatment-resistant depression, pain disorders; possibly efficacious for anxiety disorders, eating disorders, substance use disorders
- **adverse effects:** common - transient local discomfort, hearing issues, cognitive changes; rare - seizure, syncope, mania induction

Neurosurgical Treatments

Ablative/Lesion Procedures

- used for intractable MDD or OCD, efficacy ranges from 25-75% depending on procedure
- **adverse effects:** related to lesion location and size, high risk of suicide in those who are not helped by surgery

Deep Brain Stimulation

- placement of small electrode leads in specific brain areas to alter neuronal signaling, usually for intractable MDD
- response rates (>50% symptom reduction) of 40-70%, adverse effects related to surgical risks and poor treatment response

Vagus Nerve Stimulation

- direct, intermittent electrical stimulation of left cervical vagus nerve via implanted pulse generator
- used for chronic, recurrent MDD that has failed previous therapy and ECT; slow onset, approximately 30% response rate at 1 yr

Other Therapy Modalities

Phototherapy (Light Box Therapy)

- bright light source exposure, best in morning, for 30-60 minutes (usually 10 000 lux)
- proposed mechanisms: reverses pathological alterations in circadian rhythm through action on suprachiasmatic nucleus
- **indications:** SAD, non-seasonal depression (as augmentation), sleep disorders
- **adverse effects:** mania induction, reaction with photosensitizing drug or photosensitive eye or skin conditions

Aerobic Exercise

- moderate-intense aerobic exercise is associated with acute increased secretion of serotonin, phenethylamine, BDNF, endogenous opioids and cannabinoids (likely this combination is what contributes to the "runner's high")
- long term increases gray matter in multiple areas, as well as improvements in cognition, memory and stress tolerance
- **indications:** ongoing research suggests efficacy as adjunctive treatment for MDD; may be helpful in PTSD, schizophrenia

Canadian Legal Issues

Common Forms

Table 23. Common Forms Under the *Mental Health Act* (in Ontario)

Form	Who Signs	When	Expiration Date	Right of Patient to Review Board Hearing	Options Before Form Expires
Form 1: Application by physician to hospitalize a patient for psychiatric assessment against his/her will to a schedule 1 facility (Form 42 given to patient)	Any MD	Within 7 d after examination of the patient	72 h after hospitalization Void if not implemented within 7 d	No	Form 3 + 30 or voluntary admission or Send home ± follow-up
Form 2: Order for a psychiatric assessment against his/her will which is ordered by Justice of the Peace	Justice of the Peace	No statutory time restriction	7 d from when completed Purpose of form is complete once patient brought to hospital	No	Form 1 + 42 or Send home ± follow-up
Form 3: Certificate of involuntary admission to a schedule 1 facility (Form 30 given to patient, notice to rights advisor)	Attending MD (different than MD who completed Form 1)	Before expiration of Form 1 Any time to change status of a voluntary patient	14 d	Yes	Form 4 + 30 or Voluntary admission (Form 5)
Form 4: Certificate of renewal of involuntary admission to a schedule 1 facility (original Form 30 given to patient, notice to rights advisor)	Attending MD following patient on Form 3	Prior to expiration of Form 3	First: 1 mo Second: 2 mo Third: 3 mo (max)	Yes	Form 4 + 30 or Voluntary admission (Form 5)
Form 5: Change to informal/voluntary status	Attending MD following patient on Form 3/4	Whenever deemed appropriate	N/A	N/A	N/A
Form 30: Notice to patient that they are now under involuntary admission on either Form 3 or 4. Original to the patient, copy to chart	Attending MD	Whenever Form 3 or Form 4 filled	N/A	Yes	N/A
Form 33: Notice to patient that patient is incapable of consenting to treatment of mental disorder, and/or management of property and/or disclosure of health information (original copy to patient)	Attending MD	Whenever deemed appropriate	N/A	Yes	N/A

* Schedule 1 Facilities: Able to provide intensive inpatient and outpatient care

Form 1: Application for Psychiatric Assessment

- Filled out when a patient is suspected of being an imminent harm to themselves (suicide) or others (homicide) or when they are incapable of self-care (e.g. not dressed for freezing weather) and are suffering from an apparent mental disorder
- Based on any combination of the physician's own observations and facts communicated by others
- Box A or Box B completed
- **Box A:** Serious Harm Test
- The Past/Present Test assesses current behaviours/threats/attempts
- The Future Test assesses the likelihood of serious harm occurring as a result of the presenting mental disorder. In this section, one should document evidence of the mental disorder
- **Box B:** Patients with a known mental disorder, who are incapable of consenting to treatment (existing substitute decision-maker), have previously received treatment and improved, and are currently at risk of serious harm due to the same mental disorder

Testing for Capacity

Test has two parts

- (1) Is the patient able to understand the information presented?
AND
- (2) Is the patient able to appreciate how this information applies to him/her and appreciate the consequences of a decision or lack of a decision?

Consent

- see [Ethical, Legal, and Organizational Medicine](#), ELOAM7

Community Treatment Order (CTO)

- purpose: a CTO orders a person suffering from a serious mental disorder to receive treatment and supervision in the community. Based on a comprehensive plan outlining medications, appointments, and other care believed necessary to allow the person to live in the community (vs. in a psychiatric facility, where things are more restrictive)
- intended for those who
 - due to their serious mental disorder, experience a pattern of admission to a psychiatric facility where condition is usually stabilized
 - after being released, these patients often lack supervision and stop treatment, leading to destabilization
 - due to the destabilization of their condition, these patients usually require re-admission to hospital
 - if CTO violated (e.g. treatment not taken), patient brought in by police to hospital for treatment as per CTO
- criteria for a physician to issue a CTO
 - patient with a prior history of hospitalization
 - a community treatment plan for the person has been made
 - examination by a physician within the previous 72 h before entering into the CTO plan
 - ability of the person subject to the CTO to comply with it
 - consultation with a rights advisor and consent of the person or the person's substitute decision maker
- CTOs are valid for 6 mo unless they are renewed or terminated at an earlier date such as:
 - where the person fails to comply with the CTO
 - when the person or his/her substitute decision-maker withdraws consent to the community treatment plan
- CTO process is consent-based and all statutory protections governing informed consent apply
- the rights of a person subject to a CTO include
 - the right to a review by the Consent and Capacity Board with appeal to the courts each time a CTO is issued or renewed
 - a mandatory review by the Consent and Capacity Board every second time a CTO is renewed
 - the right to request a re-examination by the issuing physician to determine if the CTO is still necessary for the person to live in the community
 - the right to review findings of incapacity to consent to treatment
 - provisions for rights advice

CTO Legislation

- Ontario passed CTO legislation on December 1, 2000 (known as "Brian's Law")
- Similar CTOs have been implemented in Saskatchewan (1995), Manitoba (1997), and British Columbia (1999)

Duty to Inform/Warn

Approach to the Respiratory Patient

Basic Anatomy Review

Figure 1. Lung lobes and bronchi

Respiration Pattern

Figure 2. Respiration patterns in normal and disease states

Differential Diagnoses of Common Presentations

Table 1. Differential Diagnosis of Dyspnea

Acute Dyspnea (minutes-hours)
Cardiac causes
Ischemic heart disease
CHF exacerbation
Cardiac tamponade
Pulmonary causes
Upper airway obstruction (anaphylaxis, foreign body)
Airway disease (asthma, COPD exacerbation, bronchitis)
Parenchymal lung disease (ARDS, pneumonia)
Pulmonary vascular disease (PE, vasculitis)
Pleural disease (pneumothorax, tension pneumothorax)
Respiratory control (metabolic acidosis, ASA toxicity)
Psychiatric causes
Anxiety/psychosomatic
Chronic Dyspnea (weeks-months)
Cardiac causes
Valvular heart disease
Decreased CO
Respiratory causes
Parenchymal lung disease (interstitial disease)
Pulmonary vascular disease (pulmonary HTN, vasculitis)
Pleural disease (effusion)
Airway disease (asthma, COPD)
Metabolic causes
Severe anemia
Hyperthyroidism
Neuromuscular and chest wall disorders
Deconditioning, obesity, pregnancy, neuromuscular disease

Table 2. Differential Diagnosis of Chest Pain
(see [Cardiology and Cardiac Surgery C4](#) and [Emergency Medicine ER21](#))

Nonpleuritic	Pleuritic
Pulmonary	Pulmonary
Pneumonia	Pneumonia
PE	PE
Neoplasm	Pneumothorax
Cardiac	Hemothorax
MI	Neoplasm
Myocarditis/pericarditis	TB
Esophageal	Empyema
GERD	Cardiac
Spasm	Pericarditis
Esophagitis	Dressler's syndrome
Ulceration	GI
Achalasia	Subphrenic abscess
Neoplasm	Pancreatitis
Esophageal rupture	MSK
Mediastinal	Costochondritis
Lymphoma	Fractured rib
Thymoma	Myositis
Subdiaphragmatic	Herpes zoster
PUD	
Gastritis	
Biliary colic	
Pancreatitis	
Vascular	
Dissecting aortic aneurysm	
MSK	
Costochondritis	
Skin	
Breast	
Ribs	

Common Causes of Clubbing

- Pulmonary: Lung CA, bronchiectasis, pulmonary fibrosis, abscess, CF, empyema (NOT COPD)
- Cardiac: Cyanotic heart disease, endocarditis, A-V fistula
- GI: IBD, celiac, cirrhosis
- Endocrine: Graves'
- Other: Other malignancy, primary hypertrophic osteoarthropathy

Clubbing is not seen in COPD – if present, think malignancy

Figure 3. Signs of nail clubbing

Table 3. Differential Diagnosis of Hemoptysis

Airway Disease
Acute or chronic bronchitis
Bronchiectasis
Bronchogenic CA
Bronchial carcinoid tumour
Parenchymal Disease
Pneumonia
TB
Lung abscess
Vascular Disease
PE
Elevated pulmonary venous pressure:
LVF
Mitral stenosis
Vascular malformation
Vasculitis
Goodpasture's syndrome
Idiopathic pulmonary hemosiderosis
Miscellaneous
Impaired coagulation
Pulmonary endometriosis

Table 4. Differential Diagnosis of Cough

Airway Irritants
Inhaled smoke, dusts, fumes
Postnasal drip (upper airway cough syndrome)
Aspiration
Gastric contents (GERD)
Oral secretions
Foreign body
Airway Disease
URTI including postnasal drip and sinusitis
Acute or chronic bronchitis
Bronchiectasis
Neoplasm
External compression by node or mass lesion
Asthma
COPD
Parenchymal Disease
Pneumonia
Lung abscess
Interstitial lung disease
CHF
Drug-induced (e.g. ACEI)

Hemoptysis

- Most common cause is bronchitis
- 90% of massive hemoptysis is from the bronchial arteries
- Considered "massive" if > 600 mL/24 h

Most Common Causes of Chronic Cough in the Non-smoking Patient (cough > 3 mo with normal CXR)

- GERD
- Asthma
- Postnasal drip
- ACEI

Adapted from: Weinberger SE. Principles of pulmonary medicine, 5th ed. 2008. With permission from Elsevier

Figure 4. Signs of respiratory distress

Pulmonary Function Tests

- useful in differentiating the pattern of lung disease (obstructive vs. restrictive)
- assess lung volumes, flow rates, and diffusion capacity (Figures 5A and 5B)
- **note:** normal values for FEV_1 are approximately $\pm 20\%$ of the predicted values (for age, sex, and height); ethnicity may affect predicted values

Table 5. Comparison of Lung Flow and Volume Parameters in Obstructive vs. Restrictive Lung Disease

	Obstructive	Restrictive
	<ul style="list-style-type: none"> • Decreased flow rates (most marked during expiration) • Air trapping (increased RV/TLC) • Hyperinflation (increased FRC, TLC) 	<ul style="list-style-type: none"> • Decreased lung compliance • Decreased lung volumes
DDx	Asthma, COPD, CF, bronchiolitis, bronchiectasis*	ILD, pleural disease, neuromuscular disease, chest wall disease
FEV_1/FVC	↓	↑ or N
TLC	↑ or N	↓
RV	↑ or N	↓
RV/TLC	↑ or N	N
DL_{CO}	↓/↑ or N	↓ or N

*Bronchiectasis can be obstructive or mixed

Table 6. Common Respiriology Procedures

Technique	Purpose	Description
Plethysmography ("body box")	Measure FRC	<ul style="list-style-type: none"> • After a normal expiration the patient inhales against a closed mouthpiece • Resultant changes in the volume and pressure of the plethysmograph are used to calculate the volume of gas in the thorax • Useful for patients with air trapping
He dilution	Measure FRC	<ul style="list-style-type: none"> • A patient breathes from a closed circuit containing a known concentration and volume of helium • Since the amount of helium remains constant, FRC is determined based on the final concentration of the helium in the closed system • Only includes airspaces that communicate with the bronchial tree
Bronchoscopy	Diagnosis and therapy	<ul style="list-style-type: none"> • A flexible or rigid bronchoscope is used for visualization of a patient's airways Allows for: <ul style="list-style-type: none"> ■ Bronchial and broncho-alveolar lavage (washings) for culture and cytology ■ Endobronchial or transbronchial tissue biopsies ■ Removal of secretions/foreign bodies/blood ■ Laser resections ■ Airway stenting • Mediastinal lymph nodes can also be sampled using a special bronchoscope equipped with an I/S probe (EBUS)

Figure 5A. Subcompartments of lung volumes

Figure 5B. Expiratory flow volume curves

Adapted with permission from Elsevier. Weinberger SE. Principles of pulmonary medicine, 5th ed. 2008

Lung Volumes

- ERV – Expiratory Reserve Volume
- FEF – Forced Expiratory Flow Rate
- FEV_1 – Forced Expiratory Volume (in one second)
- FRC – Functional Residual Capacity
- IC – Inspiratory Capacity
- RV – Residual Volume
- TLC – Total Lung Capacity
- VC – Vital Capacity
- V_T – Tidal Volume

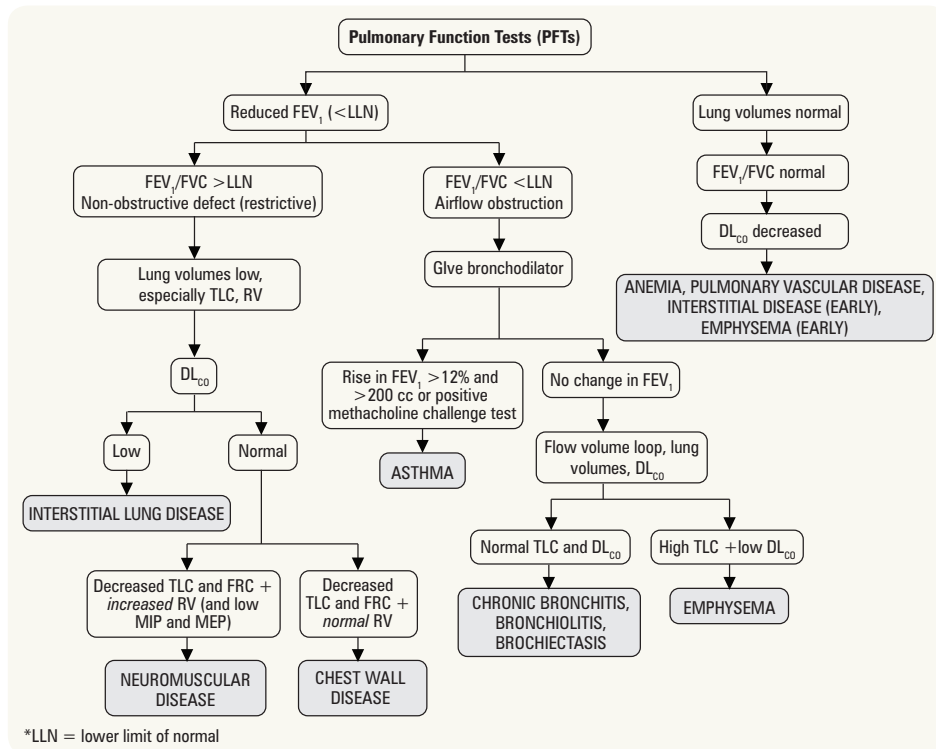

Figure 6. Interpreting PFTs

Chest X-Rays

- see [Medical Imaging](#), MI4

Table 7. CXR Patterns and Differential Diagnosis

Pattern	Signs	Common DDx
Consolidation ("Airspace disease")	Air bronchogram Silhouette sign Less visible blood vessels	<u>Acute</u> : water (pulmonary edema), pus (pneumonia), blood (hemorrhage) <u>Chronic</u> : neoplasm (lymphoma), inflammatory (eosinophilic pneumonia), infection (TB, fungal)
Reticular ("Interstitial disease")	Increased pulmonary markings Honeycombing (IPF)	ILD (IPF, collagen vascular disease, asbestos, drugs)
Nodular	Cavitary vs. non-cavitary	<u>Cavitary</u> : neoplasm (primary vs. metastatic lung cancer), infectious (anaerobic or Gram negative, TB, fungal), inflammatory (RA, Granulomatosis with Polyangiitis (GPA)) <u>Non-cavitary</u> : above + sarcoid, Kaposi's sarcoma (in HIV), silicosis and other pneumoconioses

Arterial Blood Gases

- provides information on acid-base and oxygenation status
- see [Nephrology](#), NP14

Approach to Acid-Base Status

1. Is the pH acidemic (pH <7.35), alkalemic (pH >7.45), or normal (pH 7.35-7.45)?
2. What is the primary disturbance?
 - metabolic: change in HCO_3^- and pH in same direction
 - respiratory: change in HCO_3^- and pH in opposite directions
3. Is there appropriate compensation? (see Table 8)
 - metabolic compensation occurs over 2-3 d reflecting altered renal HCO_3^- production and excretion
 - respiratory compensation through ventilatory control of P_aCO_2 occurs immediately
 - inadequate compensation may indicate a second acid-base disorder

Figure 7. Oxygen-Hb dissociation curve

Factors that Shift the Oxygen-Hb Dissociation Curve to the Right

"CADET, face right!"

CO₂
Acid
2,3-DPG
Exercise
Temperature (increased)

Table 8. Expected Compensation for Specific Acid-Base Disorders

Disturbance	P _a CO ₂ (mmHg) (normal ~40)	HCO ₃ ⁻ (mmHg) (normal ~24)
Respiratory Acidosis		
Acute	↑ 10	↑ 1
Chronic	↑ 10	↑ 3
Respiratory Alkalosis		
Acute	↓ 10	↓ 2
Chronic	↓ 10	↓ 5
Metabolic Acidosis	↓ 1	↓ 1
Metabolic Alkalosis	↑ 5-7	↑ 10

- If there is metabolic acidosis, what is the anion gap and osmolar gap?
 - anion gap = [Na⁺] - ([Cl⁻] + [HCO₃⁻]); normal ≤10-15 mmol/L
 - osmolar gap = measured osmolarity - calculated osmolarity = measured - (2[Na⁺] + glucose + urea); normal ≤10 mmol/L
- If anion gap is increased, is the change in bicarbonate the same as the change in anion gap?
 - if not, consider a mixed metabolic picture

Table 9. Differential Diagnosis of Respiratory Acidosis

<i>Increased P_aCO₂ secondary to hypoventilation</i>
Respiratory Centre Depression (Decreased RR)
Drugs (anesthesia, sedatives, narcotics)
Trauma
Increased ICP
Encephalitis
Stroke

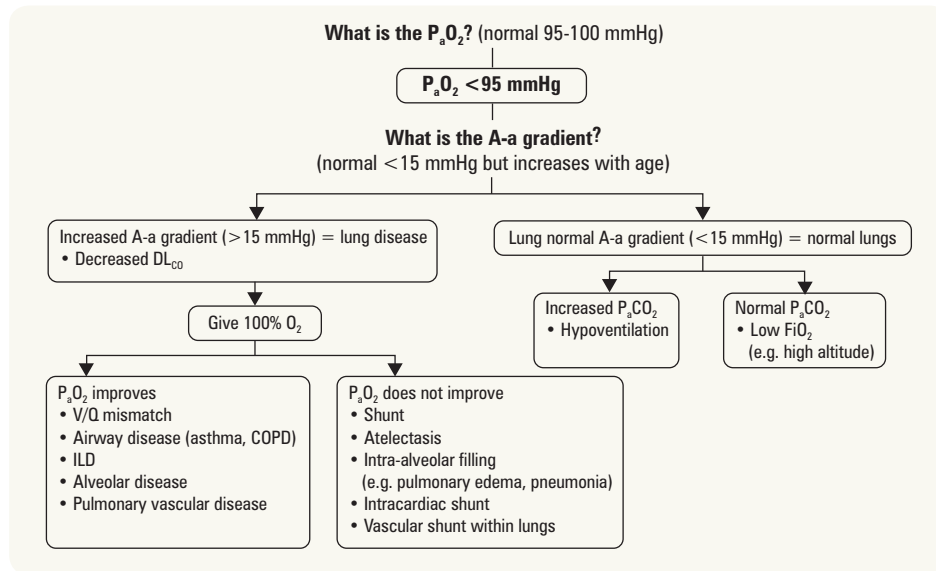

Figure 8. Approach to hypoxemia

Figure 9. Pathophysiology of shunt

At Sea Level on Room Air

$FiO_2 = 0.21$
 $P_{atm} = 760$ mmHg
 $PH_2O = 47$ mmHg
 $RQ = 0.8$
 Thus, A-a DO_2 Gradient on Room Air
 $A-aDO_2 = (150 - 1.25 [P_aCO_2]) - P_aO_2$

Diffusion Capacity for Carbon Monoxide (DL_{CO})

DL_{CO} decreases with:

- Decreased surface area (e.g. emphysema)
- Decreased hemoglobin
- Interstitial lung disease
- Pulmonary vascular disease

DL_{CO} increases with:

- Asthma
- Pulmonary hemorrhage
- Polycythemia
- Increased pulmonary blood volume

Pulmonary Shunt

Occurs when the capillary networks of the alveoli are perfused, yet there is a lack of adequate ventilation (and thus oxygenation) in that alveolus or group of alveoli. Thus this blood enters the pulmonary venous system without being oxygenated

Airway Obstruction (decreased FEV_1)

- Asthma
- COPD (chronic bronchitis, emphysema)
- Bronchiectasis
- Cystic fibrosis

Red Flags

Severe tachypnea/tachycardia, respiratory muscle fatigue, diminished expiratory effort, cyanosis, silent chest, decreased LOC

Central cyanosis is not detectable until SaO_2 is <85%. It is more easily detected in polycythemia and less readily detectable in anemia

Asthma Action Plan

Is a written plan developed by patients and their physicians which includes signs and symptoms for patients to recognize their current level of respiratory distress (denoted as 'green', 'yellow', or 'red/emergency' zones) and the personalized treatment options for each zone

Diseases of Airway Obstruction

Pneumonia

- see [Infectious Diseases](#), ID7

Asthma

- see [Family Medicine](#), FM16 and [Pediatrics](#), P89

Definition

- chronic inflammatory disorder of the airways resulting in episodes of reversible bronchospasm causing airflow obstruction
- associated with reversible airflow limitation and airway hyper-responsiveness to endogenous or exogenous stimuli

Epidemiology

- common, 7-10% of adults, 10-15% of children
- most children with asthma significantly improve in adolescence
- often family history of atopy (asthma, allergic rhinitis, eczema)
- occupational asthma (organic allergies, isocyanates, animals, etc.)

Pathophysiology

- airway obstruction → V/Q mismatch → hypoxemia → ↑ ventilation → ↓ P_aCO₂ → ↑ pH and muscle fatigue → ↓ ventilation, ↑ P_aCO₂/↓ pH

Signs and Symptoms

- dyspnea, wheezing, chest tightness, cough (especially nocturnal), sputum
- symptoms can be paroxysmal or persistent
- signs of respiratory distress (see Figure 4)
- pulsus paradoxus

Table 11. Criteria for Determining if Asthma is Well Controlled

Daytime symptoms <4 d/wk	No asthma-related absence from work/school
Night-time symptoms <1 night/wk	β ₂ -agonist use <4 times/wk
Physical activity normal	FEV ₁ or PEF >90% of personal best
Exacerbations mild, infrequent	PEF diurnal variation <10-15%

Adapted from: *Can Respir J* 2012; 19:127-164

Investigations

- O₂ saturation
- ABGs (consider in acute exacerbation, along with peak flows, in Emergency Department)
 - decreased P_aO₂ during attack (V/Q mismatch)
 - decreased P_aCO₂ in mild asthma (hyperventilation)
 - normal or increased P_aCO₂ is an ominous sign: patient is no longer able to hyperventilate (worsened airway obstruction or respiratory muscle fatigue)
- PFTs (do when stable)

Table 12. Pulmonary Function Criteria for Diagnosis of Asthma

Preferred Measurement	Alternative Measurements
Spirometry Showing Reversible Airway Obstruction (1) ↓ FEV ₁ /FVC below lower limit of normal (<0.75 to 0.8 in adults, <0.8-0.9 in children age 6+)	Peak Expiratory Flow Variability (1) ↑ in PEF after a bronchodilator or course of controller therapy <ul style="list-style-type: none"> Adults: PEF ↑ 60 L/min (min. 20%) OR Diurnal variation >8% for twice daily readings (20% for multiple daily readings) Children age 6+: PEF ↑ 20%
AND (2) ↑ FEV ₁ ≥12% (min. 200 mL in adults) after bronchodilator or controller therapy	Positive Challenge Test (1) Methacholine challenge: PC ₂₀ <4 mg/mL (4-16 mg/mL is borderline; >16 mg/mL is negative) OR (2) Post-exercise: ↓ FEV ₁ ≥10-15%

Adapted from: *Can Respir J* 2012; 19:127-164

Treatment

- environment: avoid triggers
- patient education: features of the disease, goals of treatment, self-monitoring
- pharmacological
 - symptomatic relief in acute episodes: short-acting β₂-agonist, anticholinergic bronchodilators, oral steroids, addition of a long acting β₂-agonist
 - long-term prevention: inhaled/oral corticosteroids, anti-allergic agents, long-acting β₂-agonists, methylxanthine, LTRA, anti-IgE antibodies (e.g. Xolair®)

Emergency Management of Asthma (see Emergency Medicine, ER29)

- inhaled β₂-agonist first line (MDI route and spacer device recommended)
- systemic steroids (PO or IV if severe)
- if severe add anticholinergic therapy ± magnesium sulphate
- rapid sequence intubation in life-threatening cases (plus 100% O₂, monitors, IV access)
- SC/IV adrenaline if caused by anaphylaxis, IV salbutamol if unresponsive
- corticosteroid therapy at discharge

Asthma Triggers

- URTIs
- Allergens (pet dander, house dust, molds, cockroach)
- Irritants (cigarette smoke, air pollution)
- Drugs (NSAIDs, β-blockers)
- Preservatives (sulphites, MSG)
- Other (emotion/anxiety, cold air, exercise, GERD)

Signs of Poor Asthma Control

DANGERS

- Daytime Sx ≥4 times/wk
- Activities reduced
- Nighttime Sx ≥1 time/wk
- GP visits
- ER visits
- Rescue puffer (SABA) use ≥4 times/wk
- School and work absences

Consider LABA for night-time symptoms

LTRA in Addition to Usual Care for Acute Asthma in Adults and Children

Cochrane DB Syst Rev 2012;CD006100

Purpose: To determine if the addition of LTRA is beneficial to patients with acute asthma receiving inhaled bronchodilators and systemic corticosteroids.

Methods: RCTs in Cochrane Airway Group's Specialised Register of trials that compared LTRA and standard vs. placebo and standard in people with acute asthma of any age.

Results: 8 trials, 1,470 adults and 470 children. For oral treatment, no significant difference between LTRAs and control in hospital admission (RR 0.86; 95% CI 0.21-3.52) or requirement for additional care (RR 0.87; 95% CI 0.60-1.68). LTRAs improved FEV₁ in adults (mean difference 0.08; 95% CI 0.01-0.14) but not in children. No significant difference in adverse events between LTRAs and control (RR 0.81; 95% CI 0.22-2.99). Similar results were found for intravenous treatment.

Conclusions: Currently, there is no evidence to support routine use of LTRAs in acute asthma.

Natural Progression of COPD

- 40s** Chronic productive cough, wheezing occasionally
- 50s** 1st acute chest illness
- 60s** Dyspnea on exertion, increasing sputum, more frequent exacerbations
- Late Stage** Hypoxemia with cyanosis, polycythemia, hypercapnia (morning headache), cor pulmonale, weight loss

GOLD Classification of the Severity of COPD

- GOLD 1** Mild FEV₁ ≥80% of predicted
- GOLD 2** Moderate 50% ≤ FEV₁ <80% of predicted
- GOLD 3** Severe 30% ≤ FEV₁ <50% of predicted
- GOLD 4** Very Severe FEV₁ <30% of predicted

Guidelines for Asthma Management

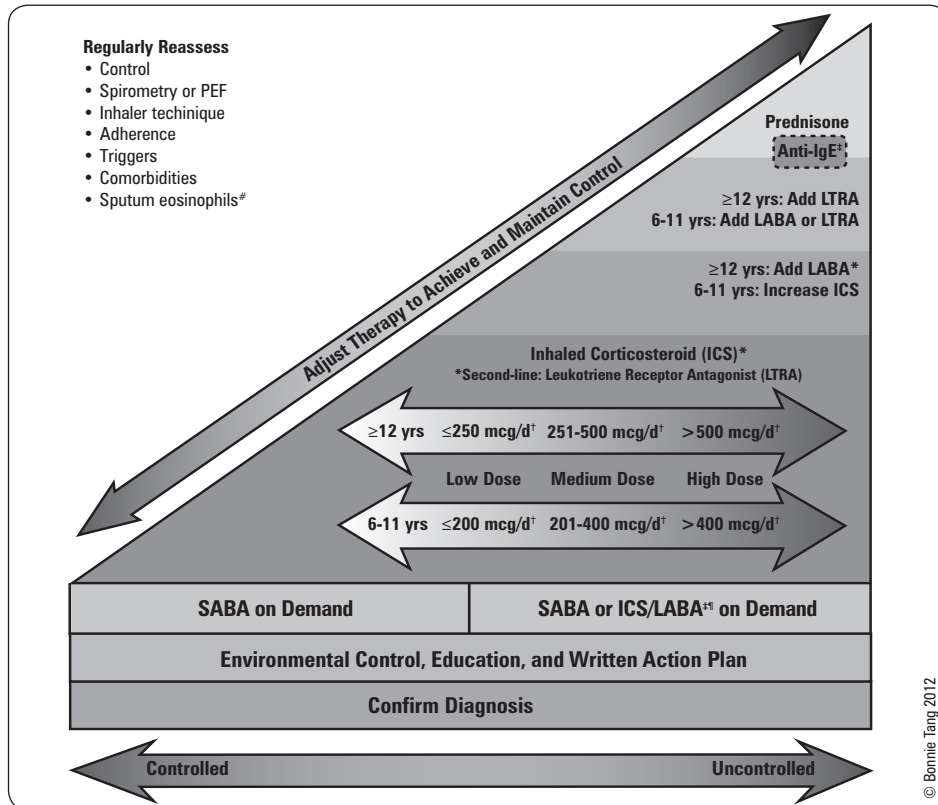

Figure 10. Guidelines for asthma management

†HFA Becomethasone or equivalent; *Second-line: LTRA; ‡Approved for 12 yr and over; §Using a formulation approved for use as a reliever; #In adults 18 yr and older with moderate to severe asthma

Adapted from: *Can Respir J* 2012;19:127-164

Remember, first line therapy for COPD is smoking cessation

α₁-Antitrypsin Deficiency

Inherited disorder of defective production of α₁-antitrypsin, a protein produced by hepatocytes. Acts in the alveolar tissue by inhibiting the action of proteases from destroying alveolar tissue. When deficient, proteases can destroy lung alveoli resulting in emphysema

CO₂ Retainers

On ABG, retainers have chronically elevated CO₂ levels with a normal pH. Maintain O₂ Sat between 88-92% to prevent Haldane effect and decreased respiratory drive

Pulmonary Embolism in Patients with Unexplained Exacerbation of COPD: Prevalence and Risk Factors

Ann Intern Med 2006;144:390-396
Study: Prospective cohort study of 211 patients with COPD (all current and former smokers) admitted to hospital for severe COPD exacerbation of unknown origin.

Measurements: All patients received spiral CT angiogram (CTA) and venous compression ultrasonography of both legs.

Results: 25% of patients met diagnostic criteria for PE (+ CTA or + U/S).

Conclusions: Prevalence of PE in patients hospitalized for COPD exacerbation of unknown origin is 25%. Therefore, all patients presenting to hospital with COPD exacerbation without obvious cause require PE workup (leg dopplers or CTA – decision of which to use depends on pre-test probability of the patient).

Non-Invasive Positive Pressure Ventilation for Treatment of Respiratory Failure due to Exacerbations of COPD

Cochrane DB Syst Rev 2004;CD004104

Study: Cochrane Systematic Review. 14 RCTs.

Population: 758 adult patients with COPD and acute respiratory failure due to COPD exacerbation.

Intervention: Usual medical care (UMC) and Non-invasive positive ventilation (NPPV) vs. UMC alone.
Primary Outcome: Treatment failure, mortality, and tracheal intubation.

Results: The risks for all primary outcomes were reduced with NPPV use: treatment failure (RR 0.48); mortality (RR 0.52); and intubation use (RR 0.61). Length of hospital stay was a significant mean 3.24 d shorter, but no difference between ICU length of stay. There is a small and significant improvement in pH (weight mean difference (WMD)=0.04), P_aCO₂ (WMD=0.40 kPa), and respiratory rate (WMD=-3.08 bpm) within 1 h post-treatment with NPPV. Complications associated with treatment were reduced in the NPPV treatment arm (RR 0.38).

Conclusion: For patients in respiratory failure due to a COPD exacerbation, NPPV is effective in reducing treatment failure, mortality, and need for intubation when used as a first line treatment adjunct to UMC.

Chronic Obstructive Pulmonary Disease

- see [Family Medicine](#), FM16

Definition

- progressive and irreversible condition of the lung characterized by chronic obstruction to airflow with many patients having periodic exacerbations, gas trapping, lung hyperinflation, and weight loss
- 2 subtypes: chronic bronchitis and emphysema (usually coexist to variable degrees)
- gradual decrease in FEV₁ over time with episodes of acute exacerbations

Table 13. Clinical and Pathologic Features of COPD*

Chronic Bronchitis	Emphysema
Defined Clinically Productive cough on most days for at least 3 consecutive months in 2 successive years Obstruction is due to narrowing of the airway lumen by mucosal thickening and excess mucus	Defined Pathologically Dilation and destruction of air spaces distal to the terminal bronchiole without obvious fibrosis Decreased elastic recoil of lung parenchyma causes decreased expiratory driving pressure, airway collapse, and air trapping
	2 Types
	1) Centriacinar (respiratory bronchioles predominantly affected) <ul style="list-style-type: none"> Typical form seen in smokers, primarily affects upper lung zones
	2) Panacinar (respiratory bronchioles, alveolar ducts, and alveolar sacs affected) <ul style="list-style-type: none"> Accounts for about 1% of emphysema cases α₁-antitrypsin deficiency, primarily affects lower lobes

*Note that both chronic bronchitis and emphysema can exist without obstruction. Only if obstruction is also present is it termed COPD

Risk Factors

- smoking is #1 risk factor
- others
 - environmental: air pollution, occupational exposure, exposure to wood smoke or other biomass fuel for cooking
 - treatable factors: α₁-antitrypsin deficiency, bronchial hyperactivity
 - demographic factors: age, family history, male sex, history of childhood respiratory infections, low socioeconomic status

Signs and Symptoms

Table 14. Clinical Presentation and Investigations for Chronic Bronchitis and Emphysema

	Symptoms	Signs	Investigations
Bronchitis (Blue Bloater*)	Chronic productive cough Purulent sputum Hemoptysis Mild dyspnea initially	Cyanosis (2° to hypoxemia and hypercapnia) Peripheral edema from RVF (cor pulmonale) Crackles, wheezes Prolonged expiration if obstructive Frequently obese	PFT: ↓ FEV ₁ , ↓ FEV ₁ /FVC N TLC, ↓ or N DL _{CO} CXR: AP diameter normal ↑ bronchovascular markings Enlarged heart with cor pulmonale
Emphysema (Pink Puffer*)	Dyspnea (± exertion) Minimal cough Tachypnea Decreased exercise tolerance	Pink skin Pursed-lip breathing Accessory muscle use Cachectic appearance due to anorexia and increased work of breathing Hyperinflation/barrel chest, hyperresonant percussion Decreased breath sounds Decreased diaphragmatic excursion	PFT: ↓ FEV ₁ , ↓ FEV ₁ /FVC ↑ TLC (hyperinflation) ↑ RV (gas trapping) ↓ DL _{CO} CXR: ↑ AP diameter Flat hemidiaphragm (on lateral CXR) ↓ heart shadow ↑ retrosternal space Bullae ↓ peripheral vascular markings

*Note that the distinction between "blue bloaters" and "pink puffers" is more of historical than practical interest as most COPD patients have elements of both

Table 15. Treatment of Stable COPD

Treatment	Details
PROLONG SURVIVAL	
Smoking cessation	Nicotine replacement, bupropion, varenicline
Vaccination	Influenza, pneumococcal vaccine
Home oxygen	Prevents cor pulmonale and decreases mortality if used > 15h/d; indicated if (1) P _a O ₂ < 55 mmHg or (2) < 60 mmHg with cor pulmonale or polycythemia
SYMPTOMATIC RELIEF (no mortality benefit)	
Bronchodilators (mainstay of current drug therapy, used in combination)	<p>Short-acting anticholinergics (e.g. ipratropium bromide) and short-acting β₂-agonists (e.g. salbutamol, terbutaline)</p> <ul style="list-style-type: none"> SABAs: rapid onset but significant side effects at high doses (e.g. hypokalemia) Short-acting anticholinergics more effective than SABAs with fewer side effects but slower onset; take regularly rather than PRN <p>LABAs (e.g. salmeterol, formoterol, indacaterol) and long-acting anticholinergics (e.g. tiotropium bromide, glycopyrronium bromide)</p> <ul style="list-style-type: none"> More sustained effects for moderate to severe COPD <p>Inhaled corticosteroid (ICS) + LABA combination (e.g. Advair®: fluticasone + salmeterol, Symbicort®: budesonide + formoterol)</p> <ul style="list-style-type: none"> ICS/LABA increases effectiveness vs. LABA alone <p>Theophylline: weak bronchodilator; limited evidence to suggest combination with bronchodilator</p> <ul style="list-style-type: none"> Side effects: nervous tremor, nausea/vomiting/diarrhea, tachycardia, arrhythmias, sleep changes <p>PDE4 inhibitor: roflumilast (Daxas®) anti-inflammatory medication useful in COPD with chronic bronchitis, severe airflow obstruction, frequent exacerbations</p>
Corticosteroids	ICS monotherapy is contraindicated and ICS should only be used with a LABA in combination in patients with a history of exacerbations COPD airways are usually inflamed but often not responsive to steroids, therefore avoid chronic systemic glucocorticoids (although oral steroids are very important when treating exacerbations)
Surgical	Lung volume reduction surgery (resection of emphysematous parts of lung, associated with higher mortality if FEV ₁ < 20%), lung transplant
Other	Patient education, eliminate respiratory irritants/allergens (occupational/environmental), exercise rehabilitation to improve physical endurance

Remember to step down therapy to lowest doses which control symptoms/signs of bronchoconstriction

Influenza Vaccine for Patients with Chronic Obstructive Pulmonary Disease

Cochrane DB Syst Rev 2006;1:CD002733
Study: Cochrane Systematic Review. 11 RCTs included, 6 specifically in COPD patients.
Population: Six of the studies were done on COPD patients in particular, while the others were on elderly and high-risk individuals. Asthma patients were excluded.
Intervention: Live or inactivated virus vaccines vs. placebo.
Outcome: Exacerbation rates, hospitalizations, mortality, lung function and adverse effects.
Results: In patients with COPD, inactivated vaccine correlated with fewer exacerbations per vaccinated subject than placebo (weighted mean difference (WMD) -0.37, 95% CI -0.64 to -0.11). Inactivated vaccine resulted in fewer influenza-related infections than placebo (WMD 0.19, 95% CI 0.07-0.48). There was also an increased risk of local mild, transient adverse reactions with the vaccine.
Conclusions: There appears to be a reduction in influenza-related infections, as well as exacerbations in patients with COPD receiving the vaccine.

Different Durations of Corticosteroid Therapy for Exacerbations of Chronic Obstructive Pulmonary Disease

Cochrane DB Syst Rev 2014:CD006897
Study: Cochrane systematic review. 8 studies.
Population: 582 patients, with severe or very severe COPD.
Intervention: Corticosteroids given at equivalent daily doses for 3-7 d (short duration) vs. 10-15 d (longer-duration).
Outcome: treatment failure, risk of relapse, time to next COPD exacerbation, likelihood of adverse event, length of hospital stay, and lung function at end of treatment.
Results: In four studies there was no difference in risk of treatment failure between short-duration and longer-duration systemic corticosteroid treatment (n = 457; odds ratio (OR) 0.72, 95% confidence interval (CI) 0.36 to 1.46), which was equivalent to 22 fewer per 1000 for short-duration treatment (95% CI 51 fewer to 34 more). No difference in risk of relapse (a new event) was observed between short-duration and longer-duration systemic corticosteroid treatment (n = 457; OR 1.04, 95% CI 0.70 to 1.56), which was equivalent to nine fewer per 1,000 for short-duration treatment (95% CI 68 fewer to 100 more). Time to the next COPD exacerbation did not differ in one large study that was powered to detect non-inferiority and compared five days versus 14 d of systemic corticosteroid treatment (n = 311; hazard ratio 0.95, 95% CI 0.66 to 1.37). In five studies no difference in the likelihood of an adverse event was found between short-duration and longer-duration systemic corticosteroid treatment (n = 503; OR 0.89, 95% CI 0.46 to 1.69, or nine fewer per 1000 [95% CI 44 fewer to 51 more]). Length of hospital stay (n = 421; mean difference (MD) -0.61 days, 95% CI -1.51 to 0.28) and lung function at the end of treatment (n = 185; MD FEV₁ -0.04 L; 95% CI -0.19 to 0.10) did not differ between short-duration and longer-duration treatment.
Conclusion: 5 d of oral corticosteroids is likely to be sufficient for treatment of adults with acute exacerbations of COPD, and this review suggests that the likelihood is low that shorter courses of systemic corticosteroids (of around five days) lead to worse outcomes than are seen with longer (10 to 14 d) courses.

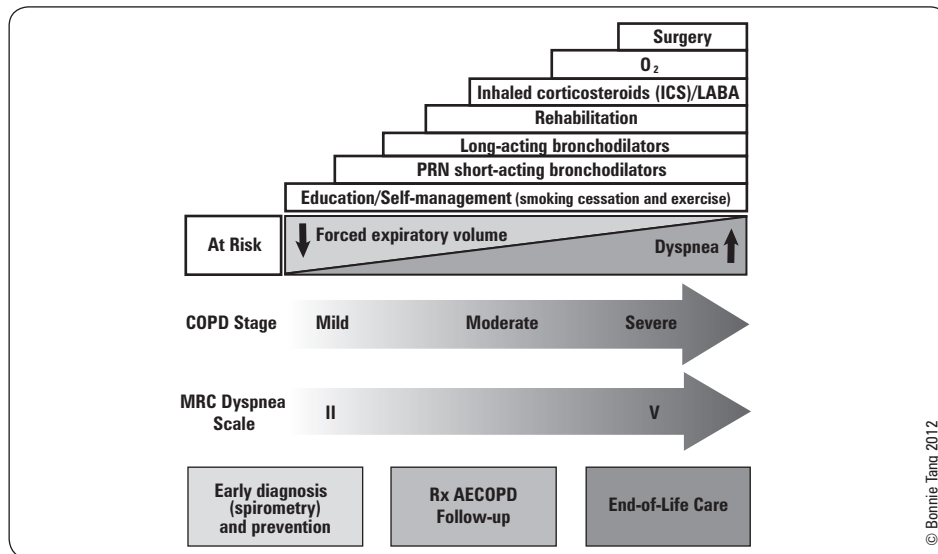

Figure 11. Guidelines for COPD Management

Adapted from: Canadian Thoracic Society recommendations for management of chronic obstructive pulmonary disease. *Can Respir J* 2008;(Suppl A):15

Acute Exacerbations of COPD

• definition

- sustained (>24-48 h) worsening of dyspnea, cough, or sputum production leading to an increased use of medications

• etiology: viral URTI, bacteria, air pollution, CHF, PE, MI must be considered

• management

- ABCs, consider assisted ventilation if decreasing LOC or poor ABGs
 - O₂: target 88-92% SaO₂ for CO₂ retainers
 - bronchodilators by MDI with spacer or nebulizer
 - ♦ SABA + anticholinergic, e.g. salbutamol and ipratropium bromide via nebulizers x 3 back-to-back q15min
 - systemic corticosteroids: IV solumedrol or oral prednisone
 - antibiotics for exacerbations with increased sputum production and at least one of the following: increased dyspnea or sputum purulence
 - ♦ simple exacerbation (no risk factors): amoxicillin, 2nd or 3rd generation cephalosporin, macrolide, or TMP/SMX
 - ♦ complicated exacerbation (one of: FEV₁ ≤50% predicted, ≥4 exacerbations per year, ischemic heart disease, home O₂ use, chronic oral steroid use): fluoroquinolone or β-lactam + β-lactamase inhibitor (amoxicillin/clavulanate)
 - post exacerbation: rehabilitation with general conditioning to improve exercise tolerance
- ### • ICU admission
- for life threatening exacerbations
 - ventilatory support
 - ♦ non-invasive: NPPV, BiPAP
 - ♦ conventional mechanical ventilation

Prognosis in COPD

• prognostic factors

- level of dyspnea is the single best predictor
- development of complications, e.g. hypoxemia or cor pulmonale

• 5 yr survival

- FEV₁ <1 L = 50%
- FEV₁ <0.75 L = 33%

• BODE index for risk of death in COPD

- greater score = higher probability the patient will die from COPD; score can also be used to predict hospitalization
- 10 point index consisting of four factors
 - ♦ Body mass index (BMI): <21 (+1 point)
 - ♦ Obstruction (FEV₁): 50-64% (+1), 36-49% (+2), <35% (+3)
 - ♦ Dyspnea (MRC scale): walks slower than people of same age on level surface, stops occasionally (+1), stops at 100 yards or a few minutes on the level (+2), too breathless to leave house or breathless when dressing/undressing (+3)
 - ♦ Exercise capacity (6 minute walk distance): 250-349 m (+1), 150-249 m (+2), <149 m (+3)

Complications of COPD

- Polycythemia 2^o to hypoxemia
- Chronic hypoxemia
- Pulmonary HTN from vasoconstriction
- Cor pulmonale
- Pneumothorax due to rupture of emphysematous bullae

Systemic Corticosteroids for Acute Exacerbations of Chronic Obstructive Pulmonary Disease

Cochrane DB Syst Rev 2014: CD001228

Study: Cochrane systematic review 16 studies.

Population: 1,787 patients with acute COPD exacerbations.

Intervention: Oral or parenteral corticosteroids vs. placebo.

Outcome: treatment failure, risk of relapse, time to next COPD exacerbation, likelihood of adverse event, length of hospital stay, and lung function at end of treatment.

Results: Systemic corticosteroids reduced the risk of treatment failure by over half compared with placebo in nine studies (n = 917) with median treatment duration 14 d, odds ratio (OR) 0.48 (95% CI 0.35-0.67). The evidence was graded as high quality and it would have been necessary to treat nine people (95% CI 7-14) with systemic corticosteroids to avoid one treatment failure. There was moderate-quality evidence for a lower rate of relapse by one month for treatment with systemic corticosteroid in two studies (n = 415) (hazard ratio (HR) 0.78; 95% CI 0.63-0.97). Mortality up to 30 d was not reduced by treatment with systemic corticosteroid compared with control in 12 studies (n = 1,319; OR 1.00; 95% CI 0.60-1.66). FEV₁, measured up to 72 hours, showed significant treatment benefits (7 studies; n = 649; mean difference (MD) 140 mL; 95% CI 90-200); however, this benefit was not observed at later time points. The likelihood of adverse events increased with corticosteroid treatment (OR 2.33; 95% CI 1.59-3.43). The risk of hyperglycemia was significantly increased (OR 2.79; 95% CI 1.86-4.19). For general inpatient treatment, duration of hospitalization was significantly shorter with corticosteroid treatment (MD -1.22 d; 95% CI -2.26 to -0.18), with no difference in length of stay in the intensive care unit (ICU) setting. Comparison of parenteral versus oral treatment showed no significant difference in the primary outcomes of treatment failure, relapse or mortality or for any secondary outcomes.

Conclusion: There is high-quality evidence to support treatment of exacerbations of COPD with systemic corticosteroid by the oral or parenteral route in reducing the likelihood of treatment failure and relapse by 1 mo, shortening length of stay in hospital inpatients not requiring assisted ventilation in ICU and giving earlier improvement in lung function and symptoms. There is no evidence of benefit for parenteral treatment compared with oral treatment with corticosteroid on treatment failure, relapse or mortality. There is an increase in adverse drug effects with corticosteroid treatment, which is greater with parenteral administration compared with oral treatment.

Bronchiectasis

Definition

- irreversible dilatation of airways due to inflammatory destruction of airway walls resulting from persistently infected mucus
- usually affects medium sized airways
- P. aeruginosa* is the most common pathogen; *S. aureus*, *H. influenzae*, and nontuberculous mycobacteria also common

Table 16. Etiology and Pathophysiology of Bronchiectasis

Obstruction	Post-Infectious (results in dilatation of bronchial walls)	Impaired Defenses (leads to interference of drainage, chronic infections, and inflammation)
Tumour	Pneumonia	Hypogammaglobulinemia
Foreign body	TB	CF
Thick mucus	Measles	Defective leukocyte function
	Pertussis	Ciliary dysfunction (Kartagener's syndrome: bronchiectasis, sinusitis, situs inversus)
	Allergic bronchopulmonary aspergillosis	
	MAC	

Signs and Symptoms

- chronic cough, purulent sputum (but 10-20% have dry cough), hemoptysis (can be massive), recurrent pneumonia, local crackles (inspiratory and expiratory), wheezes
- clubbing
- may be difficult to differentiate from chronic bronchitis

Investigations

- PFTs: often demonstrate obstructive pattern but may be normal
- CXR
 - nonspecific: increased markings, linear atelectasis, loss of volume in affected areas
 - specific: "tram tracking" – parallel narrow lines radiating from hilum, cystic spaces, honeycomb like structures
- high-resolution thoracic CT (diagnostic, gold standard)
 - 87-97% sensitivity, 93-100% specificity
 - "signet ring": dilated bronchi with thickened walls where diameter bronchus > diameter of accompanying artery
- sputum cultures (routine + AFB)
- serum Ig levels
- sweat chloride if cystic fibrosis suspected (upper zone predominant)

Treatment

- vaccination: influenza and Pneumovax®
- antibiotics (oral, IV, inhaled): routinely used for mild exacerbations, driven by sputum sensitivity; macrolides may be used chronically for an anti-inflammatory effect
- inhaled antibiotics (tobramycin) used chronically to suppress pseudomonas and reduce exacerbations
- inhaled corticosteroids: decrease inflammation and improve FEV₁
- oral corticosteroids for acute, major exacerbations
- chest physiotherapy, breathing exercises, physical exercise
- pulmonary resection: in selected cases with focal bronchiectasis

Cystic Fibrosis

- see [Pediatrics](#), P90

Pathophysiology

- chloride transport dysfunction: thick secretions from exocrine glands (lung, pancreas, skin, reproductive organs) and blockage of secretory ducts

Clinical Features

- results in severe lung disease, pancreatic insufficiency, diabetes, and azoospermia
- other manifestations: meconium ileus in infancy, distal ileal obstruction in adults, sinusitis, liver disease
- chronic lung infections
 - S. aureus*: early
 - P. aeruginosa*: most common
 - B. cepacia*: worse prognosis but less common
 - Aspergillus fumigatus*

Investigations

- sweat chloride test
 - increased concentrations of NaCl and K⁺ ([Cl⁻] >60 mmol/L is diagnostic in children)
 - heterozygotes have normal sweat tests (and no symptoms)

Usually presents in childhood as recurrent lung infections that become persistent and chronic

- PFTs
 - early: airflow limitation in small airways
 - late: severe airflow obstruction, hyperinflation, gas trapping, decreased DL_{CO} (very late)
- ABGs
 - hypoxemia, hypercapnia later in disease with eventual respiratory failure and cor pulmonale
- CXR
 - hyperinflation, increased pulmonary markings (especially upper lobes)

Treatment

- chest physiotherapy and postural drainage
- bronchodilators (salbutamol \pm ipratropium bromide)
- inhaled mucolytic (reduces mucus viscosity), hypertonic saline DNase
- inhaled tobramycin
- antibiotics (e.g. ciprofloxacin)
- lung transplant
- pancreatic enzyme replacements

Prognosis

- depends on: infections (cepacia colonization), FEV_1 , acute pulmonary exacerbations, lung transplant vs. non-lung transplant

Interstitial Lung Disease

Definition

- a group of disorders which cause progressive scarring of lung tissue
- this scarring can eventually impair lung function and gas exchange

Pathophysiology

- inflammatory and/or fibrosing process in the alveolar walls \rightarrow distortion and destruction of normal alveoli and microvasculature
- typically associated with
 - lung restriction (decrease in TLC and VC)
 - decreased lung compliance (increased or normal FEV_1/FVC)
 - impaired diffusion (decreased DL_{CO})
 - hypoxemia due to V/Q mismatch (usually without hypercapnia until end stage)
 - pulmonary HTN and cor pulmonale occur with advanced disease secondary to hypoxemia and blood vessel destruction

Etiology

- >100 known disorders can cause ILD
- majority due to unknown agents or cause

Table 17. Interstitial Lung Diseases

UNKNOWN ETIOLOGY		
Idiopathic interstitial pneumonias	Sarcoidosis	
UIP (usual interstitial pneumonia e.g. IPF)	Langerhans-cell histiocytosis (eosinophilic granuloma)	
NSIP (non-specific interstitial pneumonia)	Lymphangioleiomyomatosis	
LIP (lymphocytic interstitial pneumonia)		
COP (cryptogenic organizing pneumonia e.g. BOOP)		
DIP (desquamative interstitial pneumonia)		
IPPFE (idiopathic pleuroparenchymal fibroelastosis)		
AFOP (acute fibrinous and organizing pneumonia)		
KNOWN ETIOLOGY		
ILD Associated with Systemic Rheumatic Disorders	ILD Associated with Drugs or Treatments	Inherited Disorders
Scleroderma	Antibiotics (nitrofurantoin)	Familial IPF
Rheumatoid arthritis	Anti-inflammatory agents (methotrexate)	Telomerase mutations
SLE	Cardiovascular drugs (amiodarone)	Neurofibromatosis
Polymyositis/dermatomyositis	Antineoplastic agents (chemotherapy agents)	Tuberous sclerosis
Anti-synthetase syndromes	Illicit drugs	Gaucher's disease
Mixed connective tissue disease	Radiation	
Environment/Occupation Associated ILD	ILD Associated with Pulmonary Vasculitis	Alveolar Filling Disorders
Hypersensitivity pneumonitis (usually organic antigen)	Granulomatosis with Polyangiitis (GPA)	Chronic eosinophilic pneumonia
Farmer's lung	Goodpasture's syndrome	Pulmonary alveolar proteinosis
Air conditioner/humidifier lung	Idiopathic pulmonary hemosiderosis	
Bird breeder's lung		
Pneumoconioses (inorganic dust)		
Silicosis		
Asbestosis		
Coal worker's pneumoconiosis		
Chronic beryllium disease		
Pneumonitis from gases/fumes/vapour		

In ILD think
FASSTEN and **BAD RASH**

Upper Lung Disease (FASSTEN)

Farmer's lung (hypersensitivity pneumonitis)
Ankylosing spondylitis
Sarcoidosis
Silicosis
TB
Eosinophilic granuloma (Langerhans-cell histiocytosis)
Neurofibromatosis

Lower Lung Disease (BAD RASH)

Bronchiolitis obliterans with organizing pneumonia (BOOP)
Asbestosis
Drugs (nitrofurantoin, hydralazine, INH, amiodarone, many chemo drugs)
Rheumatologic disease
Aspiration
Scleroderma
Hamman Rich (acute interstitial pneumonia) and IPF

Signs and Symptoms

- dyspnea, especially on exertion
- nonproductive cough
- crackles (dry, fine, end-inspiratory)
- clubbing (especially in IPF and asbestosis)
- features of cor pulmonale
- note that signs and symptoms vary with underlying disease process
 - e.g. sarcoidosis is seldom associated with crackles and clubbing

Investigations

- CXR/high resolution CT (see [Medical Imaging](#), MI7)
 - usually decreased lung volumes
 - reticular, nodular, or reticulonodular pattern (nodular <3 mm)
 - hilar/mediastinal adenopathy (especially in sarcoidosis)
- PFTs
 - restrictive pattern: decreased lung volumes and compliance
 - normal or increased FEV₁/FVC (>70-80%), e.g. flow rates are often normal or high when corrected for absolute lung volume
 - DL_{CO} decreased due to V/Q mismatch (less surface area for gas exchange ± pulmonary vascular disease)
- ABGs
 - hypoxemia and respiratory alkalosis may be present with progression of disease
- other
 - bronchoscopy, bronchoalveolar lavage, lung biopsy
 - ESR, ANA (lupus), RF (RA), serum-precipitating antibodies to inhaled organic antigens (hypersensitivity pneumonitis), c-ANCA (GPA), anti-GBM (Goodpasture's)

The CXR can be normal in up to 15% of patients with interstitial lung disease

Unknown Etiologic Agents

IDIOPATHIC PULMONARY FIBROSIS

Definition

- also known as usual interstitial pneumonia or cryptogenic fibrosing alveolitis
- a progressive, irreversible condition characterized by fibrosis of lung parenchyma with no known cause
 - chest CT usually shows honeycomb lung, lung biopsy shows UIP (usual interstitial pneumonia) pattern
 - ♦ commonly presents over age 50, incidence rises with age; males > females
- DDx
 - other idiopathic interstitial pneumonia, especially NSIP, but also COP and
 - ♦ desquamative interstitial pneumonitis (DIP)
 - ♦ lymphocytic interstitial pneumonitis (LIP): usually 2° to immune conditions such as HIV (mostly in children), Sjögren's

IPF Prevalence

- Age 35-44: 2-7 per 100,000
- Age > 75: 175 per 100,000

Signs and Symptoms

- commonly presents over age 50, incidence rises with age; males > females
- dyspnea on exertion, nonproductive cough, constitutional symptoms, late inspiratory fine crackles at lung bases, clubbing

Investigations

- labs (nonspecific, autoimmune serology usually negative)
- CXR: reticular or reticulonodular pattern with lower lung predominance; may appreciate honeycombing in advanced disease
- high resolution CT: lower zone peripheral reticular markings, traction bronchiectasis, honeycombing; ground glass, consolidation, or nodules should not be prominent in IPF
- biopsy: rarely for UIP as honeycombing makes radiologic diagnosis possible

Treatment

- O₂
- N-acetylcysteine (anti-oxidant)
- pirfenidone and nintedanib may slow disease progression
- lung transplantation for advanced disease
- mean survival of 3-5 yr after diagnosis

SARCOIDOSIS

Definition

- idiopathic non-infectious granulomatous multi-system disease with lung involvement in 90%
- characterized pathologically by non-caseating granulomas
- numerous HLA antigens have been shown to play a role and familial sarcoidosis is now recognized

Epidemiology

- typically affects young and middle-aged patients
- higher incidence among African Americans and people at northern latitudes e.g. Scandinavia, Canada

Signs and Symptoms

- asymptomatic, cough, dyspnea, fever, arthralgia, malaise, erythema nodosum, chest pain
- chest exam often normal
- common extrapulmonary manifestations
 - cardiac (arrhythmias, sudden death)
 - eye involvement (anterior or posterior uveitis)
 - skin involvement (skin papules, erythema nodosum, lupus pernio)
 - peripheral lymphadenopathy
 - arthralgia
 - hepatomegaly ± splenomegaly
- less common extra-pulmonary manifestations involve bone, CNS, kidney
- two acute sarcoid syndromes
 - Lofgren's syndrome: fever, erythema nodosum, bilateral hilar lymphadenopathy, arthralgias
 - Heerfordt-Waldenstrom syndrome: fever, parotid enlargement, anterior uveitis, facial nerve palsy

Investigations

- CBC (cytopenias from spleen or marrow involvement)
- serum electrolytes, creatinine, liver enzymes, calcium (hypercalcemia/hypercalciuria due to vitamin D activation by granulomas)
- hypergammaglobulinemia, occasionally RF positive
- elevated serum ACE (non-specific and non-sensitive)
- CXR: predominantly nodular opacities especially in upper lung zones ± hilar adenopathy
- PFTs: normal, obstructive pattern, restrictive pattern with normal flow rates and decreased DL_{CO} , or mixed obstructive/restrictive pattern
- ECG: to rule out conduction abnormalities
- slit-lamp eye exam: to rule out uveitis

Diagnosis

- biopsy
 - transbronchial lung biopsy, transbronchial lymph node aspiration, endobronchial ultrasound guided surgical (EBUS) biopsy, or mediastinoscopic lymph node biopsy for granulomas
 - in ~75% of cases, transbronchial biopsy shows granulomas in the parenchyma even if the CXR is normal

Staging

- radiographic, based on CXR
 - Stage 0: normal radiograph
 - Stage I: bilateral hilar lymphadenopathy ± right paratracheal lymphadenopathy
 - Stage II: bilateral hilar lymphadenopathy and diffuse interstitial disease
 - Stage III: interstitial disease only (reticulonodular pattern or nodular pattern)
 - Stage IV: pulmonary fibrosis (honeycombing)

Treatment

- 85% of stage I resolve spontaneously
- 50% of stage II resolve spontaneously
- steroids for symptoms, declining lung function, hypercalcemia, or involvement of eye, CNS, kidney, or heart (not for abnormal CXR alone)
- methotrexate or other immunosuppressives occasionally used

Prognosis

- approximately 10% mortality secondary to progressive fibrosis of lung parenchyma

Most common presentation: asymptomatic CXR finding

Hilar adenopathy refers to enlargement of mediastinal lymph nodes which is most often seen by standard CXR as spherical/ellipsoidal and/or calcified nodes. If unilateral - think neoplasia, TB, or sarcoid. If bilateral - think sarcoid or lymphoma

Corticosteroids for Pulmonary Sarcoidosis

Cochrane DB Syst Rev 2005;CD001114

Study: Meta-analysis of 13 RCTs involving 1,066 participants examining the use of steroids (oral or inhaled) in sarcoidosis.

Results: Oral steroids demonstrated an improvement in CXR (RR 1.46, 95% CI 1.01-2.09). For inhaled corticosteroids, two studies showed no improvement in lung function and one study showed an improvement in diffusing capacity. No data on side-effects.

Conclusions: Oral steroids improve CXR findings and global scores of CXR, symptoms, and spirometry over 3-24 mo, but do not improve lung function or modify disease course. Oral steroids may be of benefit for patients with Stage 2 and 3 disease.

Known Etiologic Agents

HYPERSENSITIVITY PNEUMONITIS

- also known as extrinsic allergic alveolitis
- non-IgE mediated inflammation of lung parenchyma (acute, subacute, and chronic forms)
- caused by sensitization to inhaled agents, usually organic dust
- pathology: airway-centered, poorly formed granulomas and lymphocytic inflammation
- exposure usually related to occupation or hobby
 - Farmer's Lung (*Thermophilic actinomycetes*)
 - Bird Breeder's/Bird Fancier's Lung (immune response to bird IgA)
 - Humidifier Lung (*Aureobasidium pullulans*)
 - Sauna Taker's Lung (*Aureobasidium* spp.)

Signs and Symptoms

- acute presentation: (4-6 h after exposure)
 - dyspnea, cough, fever, chills, malaise (lasting 18-24 h)
 - CXR: diffuse infiltrates
 - type III (immune complex) reaction
- subacute presentation: more insidious onset than acute presentation
- chronic presentation
 - insidious onset
 - dyspnea, cough, malaise, anorexia, weight loss
 - PFTs: progressively restrictive
 - CXR: predominantly upper lobe reticulonodular pattern
 - type IV (cell mediated, delayed hypersensitivity) reaction (see [Rheumatology](#), RH2)
- in both acute and chronic reactions, serum precipitins may be detectable (neither sensitive nor specific)

Calcified diaphragmatic plaques are highly suggestive of asbestosis, especially if bilateral

CXR Fibrotic Patterns

- Asbestosis: lower > upper lobes
- Silicosis: upper > lower lobes
- Coal: upper > lower lobes

Remember to involve occupational health and place of work for data collection and treatment plan.
Also counsel re: worker's insurance as per jurisdiction (e.g. Workers Safety Insurance Board [WSIB] in Ontario)

Treatment

- early diagnosis: avoidance of further exposure is critical as chronic changes are irreversible
- systemic corticosteroids can relieve symptoms and speed resolution

PNEUMOCONIOSES

- reaction to inhaled inorganic dusts 0.5-5 µm in size
- no effective treatment, therefore key is exposure prevention through the use of protective equipment
- smoking cessation, annual influenza and pneumococcal vaccination, rehabilitation, lung transplant for endstage disease

Table 18. Pneumoconioses

Diagnosis	Etiology	Symptoms	Investigations	Complications
Asbestosis	Exposure risks: insulation, shipyard, construction, brake linings, pipe fitters, plumbers Slowly progressive diffuse interstitial fibrosis induced by inhaled asbestos fibres Usually >10-20 yr of exposure; may develop with shorter but heavier exposure; typically prolonged interval (20-30 yr) between exposure and clinical disease	Insidious onset Dyspnea Cough: paroxysmal, non-productive Fine end-expiratory crackles (increased at bases) Clubbing (much more likely in asbestosis than silicosis or CWP)	CXR Lower > upper lobe Reticulonodular pattern, may develop IPF-like honeycombing Asbestos exposure can also cause pleural and diaphragmatic plaques (± calcification), pleural effusion, round atelectasis Microscopic examination reveals ferruginous bodies: yellow-brown rod-shaped structures which represent asbestos fibres coated in macrophages	Asbestos exposure increases risk of bronchogenic CA and malignant mesothelioma Risk of lung cancer dramatically increased for smokers
Silicosis	At risk population: sandblasters, rock miners, stone cutters, quarry and highway workers Generally requires >20 yr exposure; may develop with much shorter but heavier exposure	Dyspnea, cough, and wheezing	CXR Upper > lower lobe Early: nodular disease (simple pneumoconiosis), lung function usually normal Late: nodules coalesce into masses (progressive massive fibrosis) Possible hilar lymph node enlargement (frequently calcified), especially "egg shell" calcification	Mycobacterial infection (e.g. TB)
Coal Worker's Pneumoconiosis (CWP)	At risk population: coal workers, graphite workers Coal and silica, coal is less fibrogenic than silica	Pathologic hallmark is coal macule Simple CWP No signs or symptoms, usually normal lung function Complicated CWP (also known as progressive massive fibrosis) Dyspnea Course: few patients progress to complicated CWP	Simple CWP CXR: multiple nodular opacities, mostly upper lobe Complicated CWP CXR: opacities larger and coalesce	Caplan's syndrome: rheumatoid arthritis and CWP present as larger nodules

INTERSTITIAL LUNG DISEASE ASSOCIATED WITH DRUGS OR TREATMENTS

Drug-Induced

- antineoplastic agents: bleomycin, mitomycin, busulfan, cyclophosphamide, methotrexate, chlorambucil, BCNU (carmustine)
- antibiotics: nitrofurantoin, penicillin, sulfonamide
- cardiovascular drugs: amiodarone, tocainide
- anti-inflammatory agents: methotrexate, penicillamine
- gold salts
- illicit drugs (heroin, methadone)
- rituximab, anti-TNF-α agents (infliximab, etanercept, adalimumab)

Radiation-Induced

- early pneumonitis: approximately 6 wk post-exposure
- late fibrosis: 6-12 mo post-exposure
- infiltrates conform to the shape of the radiation field

Pulmonary Vascular Disease

Pulmonary Hypertension

Definition

- mean pulmonary arterial pressure >25 mmHg at rest and >30 mmHg with exercise, or a systolic pulmonary artery pressure of >40 mmHg at rest
- in the past, pulmonary HTN was classified as primary or secondary pulmonary HTN, but this classification was modified to a more clinically useful, treatment based classification

Table 19. World Health Organization Classification of Pulmonary Hypertension

Classification	Some Causes	Treatment Options	Consider in All Patients with PH
I. Pulmonary Arterial HTN	Idiopathic Collagen vascular disease (scleroderma, SLE, RA) Congenital systemic-to-pulmonary shunts (Eisenmenger syndrome) Portopulmonary HTN HIV infection Drugs and toxins (e.g. anorexigens) Pulmonary veno-occlusive disease Schistosomiasis Pulmonary capillary hemangiomatosis Sickle cell disease	No effective treatment CCBs or advanced therapy often needed The latter includes: prostanooids, endothelin receptor antagonists, PDE5 inhibitors Lung transplantation	
II. Pulmonary HTN due to Left Heart Disease	Left-sided atrial or ventricular heart disease (e.g. LV dysfunction) Left-sided valvular heart disease (e.g. aortic stenosis, mitral stenosis)	Treat underlying heart disease	Oxygen therapy Exercise Consider anticoagulation
III. Pulmonary HTN due to Lung Disease and/or Hypoxia	Parenchymal lung disease (COPD, interstitial fibrosis, cystic fibrosis) Chronic alveolar hypoxia (chronic high altitude, alveolar hypoventilation disorders, sleep-disordered breathing)	Treat underlying cause of hypoxia and correct with supplemental oxygen (proven mortality benefit)	
IV. Chronic Thromboembolic Pulmonary HTN (CTEPH)	Thromboembolic obstruction of proximal pulmonary arteries Obstruction of distal pulmonary arteries – PE (thrombus, foreign material, tumour, <i>in situ</i> thrombosis)	Anticoagulation, thromboendarterectomy	
V. Pulmonary HTN with Unclear Multifactorial Mechanisms	Hematologic disorders Systemic disorders (e.g. sarcoidosis) Metabolic disorders Extrinsic compression of central pulmonary veins (tumour, adenopathy, fibrosing mediastinitis)	Treat underlying cause	

Adapted from: Simonneau G, et al. *J Am Coll Cardio* 2009;54(1 Suppl):S43-S54

Mechanisms of Pulmonary Hypertension (simplified)

- hypoxic vasoconstriction
 - chronic hypoxia causes pulmonary vasoconstriction by a variety of actions on the pulmonary artery endothelium and smooth muscle cells, such as: down regulation of endothelial nitric oxide synthase and alteration of voltage gated potassium channels leading to vasoconstriction
 - causes: COPD, chronic alveolar hypoxia
- decreased area of pulmonary vascular bed
 - leads to a rise in resting pulmonary arterial pressure
 - causes: collagen vascular disease, HIV infection, drugs and toxins, thrombotic or embolic disease, inflammatory, pulmonary capillary hemangiomatosis, interstitial fibrosis, CF
- volume and pressure overload
 - significant HTN only occurs with excessive volume overload, since pulmonary artery pressure will not rise in otherwise normal lung until pulmonary blood flow exceeds 2.5x the basal rate
 - causes: congenital systemic-to-pulmonary shunts (e.g. VSD, ASD, PDA), portopulmonary HTN, left-sided heart conditions, pulmonary veno-occlusive disease, extrinsic compression of central pulmonary veins

Pulmonary arterial pressures are measured by pulmonary artery catheters (i.e. Swan-Ganz catheter) which are inserted into a large vein (often internal jugular). A balloon at the end of the catheter tip is inflated causing the catheter to advance through the right side of the heart and into the pulmonary artery. This allows for the measurement of RA, RV, PA, and pulmonary capillary wedge pressures as well as sampling of mixed venous blood. A thermistor near the end of the catheter also allows for assessment of cardiac output by thermodilution

IDIOPATHIC PULMONARY ARTERIAL HYPERTENSION (PRIMARY PULMONARY HYPERTENSION)

Definition

- pulmonary HTN in the absence of a demonstrable cause
- exclude:
 - left-sided cardiac valvular disease
 - myocardial disease
 - congenital heart disease
 - any clinically significant parenchymal lung disease
 - systemic connective-tissue disease
 - chronic thromboembolic disease

Epidemiology

- usually presents in young females (20-40 yr); mean age of diagnosis is 36 yr
- most cases are sporadic; familial predisposition in 10% of cases, some linked to mutations in BMPR2
- may be associated with the use of anorexic drugs (e.g. Aminorex®, Fenfluramine*), amphetamines, and cocaine

Signs and Symptoms

Table 20. Signs and Symptoms of Pulmonary Hypertension

Symptoms	Signs
Dyspnea	Loud, palpable P ₂
Fatigue	RV heave
Retrosternal chest pain	Right-sided S ₄ (due to RVH)
Syncope	Systolic murmur (tricuspid regurgitation [TR])
Symptoms of underlying disease	If RV failure: right sided S ₃ , increased JVP, positive HJR, peripheral edema, TR Reynaud's phenomenon

Investigations

- CXR: enlarged central pulmonary arteries, cardiac changes due to RV enlargement (filling of retrosternal air space)
- ECG
 - RVH/right-sided strain (see [Cardiology and Cardiac Surgery](#), C36)
- 2-D echo doppler assessment of right ventricular systolic pressure
- cardiac catheterization: direct measurement of pulmonary artery pressures (necessary to confirm diagnosis)
- PFTs to asses for underlying lung disease: DL_{CO} usually reduced; volumes and flows normal
- CT angiogram to assess lung parenchyma and possible PE
- V/Q scan ± pulmonary angiogram to rule out thromboembolic disease
- serology: ANA positive in 30% of patients with primary pulmonary HTN; other serologic markers can be used in the appropriate clinical setting

Treatment

- see Table 19

Prognosis

- 2-3 yr mean survival from time of diagnosis
- survival decreases to approximately 1 yr if severe pulmonary HTN or right-heart failure

Guidelines for Vasodilator Response in Pulmonary Arterial HTN

- Patients with IPAH that respond to vasodilators acutely, have an improved survival with long-term use of CCBs
- Vasoreactivity testing: short-acting agent such as IV epoprostenol, IV adenosine, or inhaled NO
- Positive vasodilator response: mean PAP fall of at least 10 mmHg to ≤40 mmHg with an increased or unchanged cardiac output (European Society of Cardiology)
- Positive vasodilator response: should be considered as candidate for trial of oral CCB therapy

Medical Therapy for Pulmonary Arterial Hypertension. ACCP Evidence-Based Clinical Practice Guidelines. Chest 2004;(Suppl)106:126

Virchow's Triad

- Venous stasis
- Endothelial cell damage
- Hypercoagulable states

Multidetector Computed Tomography for Acute Pulmonary Embolism (PIOPED II Trial)

NEJM 2006;354:2317-2327

Study: Multicentre, prospective study investigating accuracy of computed tomography angiography (CTA) alone and combined with venous phase imaging (CTA-CTV) for the diagnosis of PE.

Patients: 824 patients of several thousand eligible for study received reference diagnosis to confirm absence or presence of PE (V/Q scan, venous compression U/S of lower extremities, and pulmonary digital-subtraction angiography [DSA] if necessary). To confirm absence, patients in whom PE was excluded were telephoned 3-6 mo after enrollment. Any deaths were reviewed by an outcome committee. All patients enrolled also underwent clinical assessment of PE (including a 'Wells' score) prior to imaging.

Outcomes: Diagnosis of pulmonary embolism.

Results: 773 of 824 patients had adequate CTAs for interpretation. PE was diagnosed in 192 of the 824 patients. Sensitivity was 83% (150 of 181 patients, 95% CI 0.76-0.92) and specificity was 96% (567 of 592 patients, 95% CI 0.93-0.97). However, the predictive value of CTA-CTV varied when clinical pre-test probability was taken into account. PPV of CTA for high, intermediate and low clinical probability were 96% (95% CI 0.78-0.99), 92% (95% CI 0.84-0.96), and 58% (95% CI 0.40-0.73), respectively. NPV of CTA for high, intermediate and low clinical probability were 60% (95% CI 0.32-0.83), 89% (95% CI 0.82-0.93), and 96% (95% CI 0.92-0.98) respectively.

Conclusion: CTA is effective for diagnosing or excluding PE in accordance with assessment of clinical pretest probability. When clinical probability is inconsistent with imaging results, further investigations are required to rule out PE.

Pulmonary Embolism

Definition

- lodging of a blood clot in the pulmonary arterial tree with subsequent increase in pulmonary vascular resistance, impaired V/Q matching, and possibly reduced pulmonary blood flow

Etiology and Pathophysiology

- one of the most common causes of preventable death in the hospital
- proximal leg thrombi (popliteal, femoral, or iliac veins) are the source of most clinically recognized pulmonary emboli
- thrombi often start in calf, but must propagate into proximal veins to create a sufficiently large thrombus for a clinically significant PE
- fewer than 30% of patients have clinical evidence of DVT (e.g. leg swelling, pain, or tenderness)
- always suspect PE if patient develops fever, sudden dyspnea, chest pain, or collapse 1-2 wk after surgery

Risk Factors

- stasis
 - immobilization: paralysis, stroke, bed rest, prolonged sitting during travel, immobilization of an extremity after fracture
 - obesity, CHF
 - chronic venous insufficiency
- endothelial cell damage
 - post-operative injury, trauma
- hypercoagulable states
 - underlying malignancy (particularly adenocarcinoma)
 - cancer treatment (chemotherapy, hormonal)
 - exogenous estrogen administration (OCP, HRT)
 - pregnancy, post-partum
 - prior history of DVT/PE, family history
 - nephrotic syndrome
 - coagulopathies: Factor V Leiden, Prothrombin 20210A variant, inherited deficiencies of antithrombin/protein C/protein S, antiphospholipid antibody, hyperhomocysteinemia, increased Factor VIII levels, and myeloproliferative disease
- increasing age

Investigations (if highly suspicious, go straight to CT angiogram)

- see [Emergency Medicine](#), ER32

Table 21. Common Investigations for Pulmonary Embolism

Investigation	Purpose/Utility
Pulmonary Angiogram (Gold Standard)	Filling defect indicative of embolus; negative angiogram excludes clinically relevant PE More invasive, and harder to perform than CT, therefore done infrequently
D-Dimer	Highly sensitive D-dimer result can exclude DVT/PE if pretest probability is already low Little value if pretest probability is high If D-dimer positive, will need further evaluation with compression U/S
CT Angiogram	Both sensitive and specific for PE Diagnosis and management uncertain for small filling defects CT may identify an alternative diagnosis if PE is not present CT scanning of the proximal leg and pelvic veins can be done at the same time and may be helpful
Venous Duplex U/S or Doppler	With leg symptoms Positive test rules in proximal DVT Negative test rules out proximal DVT Without leg symptoms Positive test rules in proximal DVT Negative test does not rule out a DVT: patient may have non-occlusive or calf DVT
ECG	Findings not sensitive or specific Sinus tachycardia most common; may see non-specific ST segment and T wave changes RV strain, RAD, RBBB, S1-Q3-T3 with massive embolization
CXR	Frequently normal; no specific features Atelectasis (subsegmental), elevation of a hemidiaphragm Pleural effusion: usually small Hampton's hump: cone-shaped area of peripheral opacification representing infarction Westermark's sign: dilated proximal pulmonary artery with distal oligemia/decreased vascular markings (difficult to assess without prior films) Dilatation of proximal PA: rare
V/Q Scan	Very sensitive but low specificity Order scan if CXR normal, no COPD Contraindication to CT (contrast allergy, renal dysfunction, pregnancy) Avoid V/Q scan if CXR abnormal or COPD Inpatient Suspect massive PE Results Normal: excludes the diagnosis of PE High probability: most likely means PE present, unless pre-test probability is low 60% of V/Q scans are nondiagnostic
Echocardiogram	Useful to assess massive or chronic PE Not routinely done
ABG	No diagnostic use in PE (insensitive and nonspecific) May show respiratory alkalosis (due to hyperventilation)

Clinical Prediction Rule for Pulmonary Embolism *J Thromb Hemost* 2000;83:416-420 Wells' Criteria

Risk Factors	Points
Clinical signs of DVT	3.0
No more likely alternative diagnosis (using H&P, CXR, ECG)	3.0
Immobilization or surgery in the previous 4 wk	1.5
Previous PE/DVT	1.5
HR >100 beats/min	1.5
Hemoptysis	1.0
Malignancy	1.0
Clinical Probability	
Low (0-2)	3%
Intermediate (3-6)	28%
High (>6)	78%
Modified Wells': >4 PE likely; ≤4 PE unlikely	
JAMA 2006	

D-dimer is elevated in patients with recent surgery, cancer, inflammation, infection, and severe renal dysfunction. It has good sensitivity and negative predictive value, but poor specificity and positive predictive value

Classic ECG finding of PE is S₁-Q₃-T₃ (inverted T₃), but most commonly see only sinus tachycardia

Evaluation of a Suspected Pulmonary Embolism

Low clinical probability of embolism

D-dimer (+ve) → CT scan (+ve) → ruled in
(-ve) → ruled out (-ve) → ruled out

Intermediate or high probability

CT scan (-ve) → ruled out
(+ve) → ruled in

Notes

- Use D-dimers only if low clinical probability, otherwise, go straight to CT
- If using V/Q scans (CT contrast allergy or renal failure):
 - Negative V/Q scan rules out the diagnosis
 - High probability V/Q scan only rules in the diagnosis if have high clinical suspicion
 - Inconclusive V/Q scan requires leg U/S to look for DVT or CT

Treatment

- admit for observation (patients with DVT only are often sent home on LMWH)
- oxygen: supplemental O₂ if hypoxemic or short of breath
- pain relief: analgesics if chest pain – narcotics or acetaminophen
- acute anticoagulation: therapeutic-dose SC LMWH or IV heparin – start ASAP
 - anticoagulation stops clot propagation, prevents new clots and allows endogenous fibrinolytic system to dissolve existing thromboemboli over months
 - get baseline CBC, INR, aPTT ± renal function ± liver function
 - for SC LMWH: dalteparin 200 U/kg once daily, enoxaparin 1 mg/kg bid or 1.5mg/kg once daily, or tinzaparin 175 U/kg once daily – no lab monitoring – avoid or reduce dose in renal dysfunction
 - for IV heparin: bolus of 75 U/kg (usually 5,000 U) followed by infusion starting at 20 U/kg/h – aim for aPTT 2-3x control
- long-term anticoagulation
 - warfarin: start the same day as LMWH/heparin – overlap warfarin with LMWH/heparin for at least 5 d and until INR in target range of 2-3 for at least 2 d
 - LMWH instead of warfarin for pregnancy, active cancer, or high bleeding risk patients
 - direct thrombin inhibitors: can treat from outset with rivaroxaban; dabigatran has been shown to have lower bleeding risk than warfarin; no monitoring required, however agents not reversible, so avoid if bleeding concerns
- IV thrombolytic therapy
 - if patient has massive PE (hypotension or clinical right heart failure) and no contraindications
 - hastens resolution of PE but may not improve survival or long-term outcome and doubles risk of major bleeding
- interventional thrombolytic therapy
 - massive PE is preferentially treated with catheter-directed thrombolysis by an interventional radiologist
 - works better than IV thrombolytic therapy and fewer contraindications
- IVC filter: only if recent proximal DVT + absolute contraindication to anticoagulation
- duration of long-term anticoagulation: individualized, however generally
 - if reversible cause for PE (surgery, injury, pregnancy, etc.): 3-6 mo
 - if PE unprovoked: 6 mo to indefinite
 - if ongoing major risk factor (active cancer, antiphospholipid antibody, etc.): indefinite

Thromboprophylaxis

- mandatory for most hospital patients: reduces DVT, PE, all-cause mortality, cost-effective
- start ASAP
- continue at least until discharge or recommend extending for 35 d post-operatively, if major orthopedic surgery

Table 22. VTE Risk Categories and Prophylaxis (see [Hematology](#), H35)

Risk Group	Prophylaxis Options
Low Thrombosis Risk Medical patients: fully mobile Surgery: <30 min, fully mobile	No specific prophylaxis Frequent ambulation
Moderate Thrombosis Risk Most general, gynecologic, urologic surgery Sick medical patients	LMWH Low dose unfractionated heparin Fondaparinux
High Thrombosis Risk Arthroplasty, hip fracture surgery Major trauma, spinal cord injury	LMWH Fondaparinux Warfarin (INR 2-3) Dabigatran Apixaban Rivaroxaban Low dose unfractionated heparin
High Bleeding Risk Neurosurgery, intracranial bleed Active bleeding	TED stockings, pneumatic compression devices LMWH or low dose heparin when bleeding risk decreases

PE Rule Out Criteria (PERC) Prospective Multicentre Evaluation of the Pulmonary Embolism Rule Out Criteria *J Thromb Hemost* 2008;6:772

- Age less than 50 yr
- Heart rate less than 100 bpm
- Oxyhemoglobin saturation ≥95 percent
- No hemoptysis
- No estrogen use
- No prior DVT or PE
- No unilateral leg swelling
- No surgery or trauma requiring hospitalization within the past 4 wk

Acute PE can probably be excluded without further diagnostic testing if the patient meets all PERC criteria AND there is a low clinical suspicion for PE, according to either the Wells' criteria or a low gestalt probability determined by the clinician prior to diagnostic testing for PE.

Extended Use of Dabigatran, Warfarin or Placebo in Venous Thromboembolism *NEJM* 2013;368:709-718

Study: Two double blind, RCTs; one comparing against placebo, the other against active treatment.
Population: 4,199 patients (2,856 in active-control study, 1,343 in placebo-control study) with VTE who had completed at least 3 mo of therapy.

Intervention: In the active-control study, patients randomized to either 150 mg dabigatran or warfarin (INR 2.0-3.0). Patients in the placebo-control study received either 150 mg dabigatran or placebo.

Outcome: Recurrence of VTE, risk of major or clinically relevant bleed.

Results: In the active-control study, there was a hazard ratio (HR) of 1.44 (95% CI 0.78-2.64 for non-inferiority) of recurrent VTE with dabigatran vs. warfarin. HR of major or clinically relevant bleed was 0.54 (95% CI 0.41-0.71). In the placebo-control study, the HR of VTE with dabigatran vs. placebo was 0.08 (95% CI 0.02-0.25). HR of major or clinically relevant bleed was 2.92 (95% CI 1.52-5.60).

Conclusions: Dabigatran appears to be non-inferior to warfarin in the prevention of VTE recurrence. Dabigatran is associated with a lower risk of major or clinically relevant bleed than warfarin, but greater than placebo.

Workup for Idiopathic VTE Thrombophilia Workup: recurrent or idiopathic DVT/PE, age <50, FHx, unusual location, massive

Malignancy Workup: 12% of patients with idiopathic VTE will have a malignancy

The Use of Unfractionated Heparin Should Be Limited to:

- Patients with severe renal dysfunction (CrCl <30 ml/min) in whom LMWH and novel oral anticoagulation should be avoided
- Patients at elevated risk of bleeding that may need rapid reversal of anticoagulation
- Patients who receive thrombolytic therapy

Pulmonary Vasculitis

Table 23. Pulmonary Vasculitis

Disease	Definition	Pulmonary Features	Extra-pulmonary Features	Investigations	Treatment
Granulomatosis with Polyangiitis (Wegener's Granulomatosis) (see Nephrology , NP23)	Systemic vasculitis of medium and small arteries	Necrotizing granulomatous lesions of the upper and lower respiratory tract	Focal necrotizing lesions of arteries and veins; crescentic glomerulonephritis	CXR: nodules, cavities, and alveolar opacities c-ANCA Tissue confirmation	Corticosteroids and cyclophosphamide or rituximab
 Churg-Strauss Syndrome (eosinophilic granulomatosis with polyangiitis)	Multisystem disorder characterized by allergic rhinitis, asthma, and prominent peripheral eosinophilia	Asthma Infiltrates	Life-threatening systemic vasculitis involving the lungs, pericardium and heart, kidneys, skin, and PNS (mononeuritis multiplex)	Peripheral eosinophilia is the most common finding p-ANCA may be positive Biopsy involved tissue	Corticosteroids
 Goodpasture's Disease (see Nephrology , NP23)	A disorder characterized by diffuse alveolar hemorrhage and glomerulonephritis caused by anti-GBM antibodies, which cross-react with basement membranes of the kidney and lung	Hemoptysis May follow an influenza infection	Anemia	CXR: may see alveolar infiltrates if hemorrhage is profuse ELISA test with anti-GBM antibodies Renal biopsy/indirect immunofluorescence shows linear staining	Acutely: corticosteroids, plasmapheresis Immunosuppressive therapy Severe cases: bilateral nephrectomy
Systemic Lupus Erythematosus, Rheumatoid Arthritis, Scleroderma	See Rheumatology , RH8				

Pulmonary Edema

- see [Cardiology and Cardiac Surgery](#), C37

Diseases of the Mediastinum and Pleura

Mediastinal Masses

Definition

- mediastinum: bound by the thoracic inlet, diaphragm, sternum, vertebral bodies, and the pleura
- can be broken down into 3 compartments: anterior, middle, and posterior

Etiology and Pathophysiology

- diagnosis is aided by location and patient's age
- anterior compartment: more likely to be malignant
 - "Four Ts" (see sidebar), lymphoma, lipoma, pericardial cyst
- middle compartment
 - pericardial cyst, bronchogenic cyst/tumour, lymphoma, lymph node enlargement, aortic aneurysm
- posterior compartment
 - neurogenic tumours, meningocele, enteric cysts, lymphoma, diaphragmatic hernias, esophageal tumour, aortic aneurysm

Signs and Symptoms

- 50% asymptomatic (mainly benign); when symptomatic, 50% are malignant
- chest pain, cough, dyspnea, recurrent respiratory infections
- hoarseness, dysphagia, Horner's syndrome, facial/upper extremity edema (SVC compression)
- paraneoplastic syndromes (e.g. myasthenia gravis [thymomas])

Investigations

- CXR (compare to previous)
- CT with contrast (anatomic location, density, relation to mediastinal vascular structures)
- MRI: specifically indicated in the evaluation of neurogenic tumours
- U/S (best for assessment of structures in close proximity to the heart and pericardium)
- radionuclide scanning: ¹³¹I (for thyroid), gallium (for lymphoma)
- biochemical studies: thyroid function, serum calcium, phosphate, PTH, AFP, β-hCG
- biopsy (mediastinoscopy, percutaneous needle aspiration)

Scleroderma is the most common collagen vascular disease affecting the lung

Differential of an Anterior Compartment Mass

4 Ts

Thymoma
Thyroid enlargement (goitre)
Teratoma
Tumours
(lymphoma, parathyroid, esophageal, angiomatous)

Mediastinal Components

Anterior: sternum to pericardium and great vessels. Includes: thymus, extrapericardial aorta and branches, great veins, lymphatic tissues
Middle: pericardium (anteriorly) posterior pericardial reflection, diaphragm, thoracic inlet. Includes: heart, intrapericardial great vessels, pericardium, trachea
Posterior: posterior pericardial reflection, posterior border of vertebral bodies, first rib to the diaphragm. Includes: esophagus, vagus nerve, thoracic duct, sympathetic chain, azygous venous system

Horner's Syndrome

Ptosis, Miosis, Anhydrosis

Management

- excision if symptomatic enlarging benign masses or concerns of malignancy
- resect bronchogenic cysts and localized neurogenic tumours via minimally invasive video assisted procedures
- exploration via sternotomy or thoracotomy
- diagnostic biopsy rather than major operation if mass is likely to be a lymphoma, germ cell tumour, or unresectable invasive malignancy
- \pm post-operative radiotherapy/chemotherapy if malignant

Mediastinitis

- most common causes: post-operative complications of cardiovascular or thoracic surgical procedures

Acute

- etiology
 - complication of endoscopy (e.g. esophageal perforation providing entry point for infection)
 - esophageal or cardiac surgery
 - tumour necrosis
- signs and symptoms
 - fever, substernal pain
 - pneumomediastinum, mediastinal compression
 - Hamman's sign (auscultatory "crunch" during cardiac systole)
- treatment
 - antibiotics, drainage, \pm surgical closure of perforation

Chronic

- usually granulomatous process or fibrosis related to previous infection (e.g. histoplasmosis, TB, sarcoidosis, syphilis)

Pleural Effusions

Definition

- excess amount of fluid in the pleural space (normally up to 25 mL)

Etiology

- disruption of normal equilibrium between pleural fluid formation/entry and pleural fluid absorption/exit
- pleural effusions are classified as transudative or exudative
 - distinguish clinically using Light's Criteria, which has a sensitivity of 98% and specificity of 83% for identifying exudative pleural effusions

Table 24. Laboratory Values in Transudative and Exudative Pleural Effusion

	Light's Criteria	Modified Light's Criteria
Protein – Pleural/Serum	>0.5	>0.5
LDH – Pleural/Serum	>0.6	>0.6
Pleural LDH	>2/3 upper limit of N serum LDH	>0.45 upper limit of N serum LDH
Exudate = at Least One Criterion Met		

Ann Intern Med 1979;77:507-513 *Chest* 1997;111:970-980

All criteria for transudate must be fulfilled to be considered a transudative effusion. If any one of the criteria for exudates is met – it is an exudate

Transudative Pleural Effusions

- pathophysiology: alteration of systemic factors that affect the formation and absorption of pleural fluid (e.g. increased capillary hydrostatic pressure, decreased plasma oncotic pressure)
- etiology
 - CHF: usually right-sided or bilateral cirrhosis
 - nephrotic syndrome, protein losing enteropathy, cirrhosis
 - pulmonary embolism (may cause transudative but more often causes exudative effusion)
 - peritoneal dialysis, hypothyroidism, CF, urinothorax

Exudative Pleural Effusions

- pathophysiology: increased permeability of pleural capillaries or lymphatic dysfunction
- etiology (see Table 25)

Transudative effusions are usually bilateral, not unilateral

Exudative effusions can be bilateral or unilateral

Table 25. Exudative Pleural Effusion Etiologies

Etiology	Examples
Infectious	Parapneumonic effusion (associated with bacterial pneumonia, lung abscess) Empyema (bacterial, fungal, TB) TB pleuritis Viral infection
Malignancy	Lung carcinoma (35%) Lymphoma (10%) Metastases: breast (25%), ovary, kidney Mesothelioma
Inflammatory	Collagen vascular diseases: RA, SLE Pulmonary embolism Post-CABG Drug reaction
Intra-Abdominal	Subphrenic abscess Pancreatic disease (elevated pleural fluid amylase) Meigs' syndrome (ascites and hydrothorax associated with an ovarian fibroma or other pelvic tumour)
Intra-Thoracic	Esophageal perforation (elevated fluid amylase)
Trauma	Chylothorax: thoracic duct disrupted and chyle accumulates in the pleural space due to trauma, tumour Hemothorax: rupture of a blood vessel, commonly by trauma or tumours Pneumothorax (spontaneous, traumatic, tension)

Signs and Symptoms

- often asymptomatic
- dyspnea: varies with size of effusion and underlying lung function
- pleuritic chest pain
- inspection: trachea deviates away from effusion, ipsilateral decreased expansion
- percussion: decreased tactile fremitus, dullness
- auscultation: decreased breath sounds, bronchial breathing and egophony at upper level, pleural friction rub

Investigations

- CXR
 - must have >200 mL of pleural fluid for visualization on PA film
 - lateral: >50 mL leads to blunting of posterior costophrenic angle
 - PA: blunting of lateral costophrenic angle
 - dense opacification of lung fields with concave meniscus
 - decubitus: fluid will shift unless it is loculated
 - supine: fluid will appear as general haziness
- CT may be helpful in differentiating parenchymal from pleural abnormalities, may identify underlying lung pathology
- U/S: detects small effusions and can guide thoracentesis
- thoracentesis: indicated if pleural effusion is a new finding; be sure to send off blood work (LDH, glucose, protein) at the same time for comparison
 - risk of re-expansion pulmonary edema if >1.5 L of fluid is removed
 - inspect for colour, character, and odour of fluid
 - analyze fluid
- pleural biopsy: indicated if suspect TB, mesothelioma, or other malignancy (and if cytology negative)
- ± U/S: detects small effusions and can guide thoracentesis
- treatment depends on cause, ± drainage if symptomatic
- CT can be helpful in differentiating parenchymal from pleural abnormalities

Table 26. Analysis of Pleural Effusion

Measure	Purpose
Protein, LDH	Transudate vs. exudate
Gram stain, Ziehl-Nielsen stain (TB), culture	Looking for specific organisms
Cell count differential	Neutrophils vs. lymphocytes (lymphocytic effusion in TB, cancer, lymphoma, serositis)
Cytology	Malignancy, infection
Glucose (low)	RA, TB, empyema, malignancy, esophageal rupture
Rheumatoid factor, ANA, complement	Collagen vascular disease
Amylase	Pancreatitis, esophageal perforation, malignancy
pH	Empyema <7.2, TB, and mesothelioma <7.3
Blood	Mostly traumatic, malignancy, PE with infarction, TB
Triglycerides	Chylothorax from thoracic duct leakage, mostly due to trauma, lung CA, or lymphoma

Appearance of Pleural Fluid

- Bloody: trauma, malignancy
- White: chylothorax, empyema
- Black: aspergillosis, amoebic liver abscess
- Yellow-green: rheumatoid pleurisy
- Viscous: malignant mesothelioma
- Ammonia odour: urinothorax
- Food particles: esophageal rupture

Role of CT in Pleural Effusion

- To assess for fluid loculation, pleural thickening and nodules, parenchymal abnormalities and adenopathy
- Helps to distinguish benign from malignant effusion and transudative from exudative effusion
- May not distinguish empyema from parapneumonic effusion

Features of Malignant Effusion

- Multiple pleural nodules
- Nodular pleural thickening

Features of Exudative Effusion

- Loculation
- Pleural thickening
- Pleural nodules
- Extrapleural fat of increased density

Appearance of Pleural Fluid

- Bloody: trauma, malignancy
- White: chylothorax, empyema
- Black: aspergillosis, amoebic liver abscess
- Yellow-green: rheumatoid pleurisy
- Viscous: malignant mesothelioma
- Ammonia odour: urinothorax
- Food particles: esophageal rupture

Treatment

- thoracentesis
- treat underlying cause
- consider indwelling pleural catheter or pleurodesis in refractory effusions

Complicated Parapneumonic Effusion

- persistent bacteria in the pleural space but fluid is non-purulent
- neutrophils, pleural fluid acidosis (pH <7.00), and high LDH
- often no bacteria grown since rapidly cleared from pleural space
- fibrin layer leading to loculation of pleural fluid
- treatment: antibiotics and drainage, treat as an empyema

Empyema

Definition

- pus in pleural space or an effusion with organisms seen on a Gram stain or culture (e.g. pleural fluid is grossly purulent)
- positive culture is not required for diagnosis

Etiology

- contiguous spread from lung infection (most commonly anaerobes) or infection through chest wall (e.g. trauma, surgery)

Signs and Symptoms

- fever, pleuritic chest pain

Investigations

- CT chest
- thoracentesis
- PMNs (lymphocytes in TB) ± visible organisms on Gram stain

Treatment

- antibiotic therapy for at least 4-6 wk (rarely effective alone)
- complete pleural drainage with chest tube
- if loculated, more difficult to drain – may require surgical drainage with video-assisted thoroscopic surgery (VATS), or surgical removal of fibrin coating to allow lung re-expansion (decortication)

Atelectasis

- see [General Surgery](#), GS10

Pneumothorax

Definition

- presence of air in the pleural space

Pathophysiology

- entry of air into pleural space raises intrapleural pressure causing partial lung deflation

Etiology

- traumatic: penetrating or non-penetrating chest injuries
- iatrogenic (central venous catheter, thoracentesis, mechanical ventilation with barotrauma)
- spontaneous (no history of trauma)
 - primary (no underlying lung disease)
 - ♦ spontaneous rupture of apical subpleural bleb of lung into pleural space
 - ♦ predominantly tall, healthy, young males
 - secondary (underlying lung disease)
 - ♦ rupture of subpleural bleb which migrates along bronchioalveolar sheath to the mediastinum then to the intrapleural space
 - ♦ necrosis of lung tissue adjacent to pleural surface (e.g. pneumonia, abscess, PCP, lung CA, emphysema)

Signs and Symptoms

- can be asymptomatic
- acute-onset pleuritic chest pain, dyspnoea

Pleural Effusions

Simple Effusion

pH >7.2, LDH <1/2 serum, glucose >2.2

Complicated Effusion

pH <7.2, LDH >1/2 serum, glucose <2.2, positive Gram stain
Needs drainage

When possible, organism-directed therapy, guided by culture sensitivities or local patterns of drug resistance, should be utilized

Need to Rule Out Life-Threatening Tension Pneumothorax

If pneumothorax with:

- Severe respiratory distress
- Tracheal deviation to contralateral side
- Distended neck veins (↑ JVP)
- Hypotension

Do not perform CXR

Needs immediate treatment

See [Emergency Medicine](#), ER11

- tachypnea, tachycardia
- tracheal deviation (contralateral deviation in tension pneumothorax)
- ipsilateral diminished chest expansion
- decreased tactile/vocal fremitus
- hyperresonance
- ipsilateral diminished breath sounds

Investigations

- CXR
 - small: separation of visceral and parietal pleura seen as fine crescentic line parallel to chest wall at apex
 - large: increased density and decreased volume of lung on side of pneumothorax
 - see [Medical Imaging](#), MI8

Treatment

- small pneumothoraces (<20% with no signs of respiratory/circulatory collapse) resolve spontaneously; breathing 100% oxygen accelerates resorption of air
- small intercostal tube with Heimlich valve for most spontaneous pneumothoraces
- large pneumothoraces or those complicating underlying lung disease require placement of a chest tube connected to underwater seal \pm suction
- for repeated episodes: pleurodesis with sclerosing agent or apical bullectomy and abrasion
- treat underlying cause (e.g. antibiotic for PCP)

Asbestos-Related Pleural Disease and Mesothelioma

Etiology and Pathophysiology

- benign manifestations of asbestos exposure
 - “benign asbestos pleural effusion”
 - ♦ exudative effusion, typically ~10 yr after exposure, resolves
 - pleural plaques, usually calcified
 - ♦ marker of exposure; usually an asymptomatic radiologic finding
- mesothelioma
 - primary malignancy of the pleura
 - decades after asbestos exposure (even with limited exposure)
 - smoking not a risk factor, but asbestos and smoking synergistically increase risk of lung cancer

Signs and Symptoms

- persistent chest pain, dyspnea, cough, bloody pleural effusion, weight loss

Investigations

- biopsy (pleuroscopic or open)
- needle biopsy may seed needle tract with tumour

Treatment

- resection (extrapleural pneumonectomy) requires careful patient selection; rarely successful (average survival <1 yr)

Respiratory Failure

Definition

- failure of respiratory system to maintain normal blood gases
- hypoxemic ($P_aO_2 < 60$ mmHg)
- hypercapnic ($P_aCO_2 > 50$ mmHg)
- acute vs. chronic (compensatory mechanisms activated)

Signs and Symptoms

- signs of underlying disease
- hypoxemia: restlessness, confusion, cyanosis, coma, cor pulmonale
- hypercapnia: headache, dyspnea, drowsiness, asterixis, warm periphery, plethora, increased ICP (secondary to vasodilatation)

Investigations

- serial ABGs
- CXR and/or CT, bronchoscopy to characterize underlying cause if unclear

Hypoxemic Respiratory Failure

Definition

- P_aO_2 decreased, P_aCO_2 normal or decreased

Treatment

- reverse the underlying pathology
- oxygen therapy: maintain oxygenation (if shunt present, supplemental O_2 is less effective; see [Anesthesia](#), A9, for oxygen delivery systems)
- ventilation, BiPAP, and PEEP/CPAP (see [Anesthesia](#), A10): positive pressure can recruit alveoli and redistribute lung fluid
- improve cardiac output: \pm hemodynamic support (fluids, vasopressors, inotropes), reduction of O_2 requirements

Table 27. Approach to Hypoxemia

Type of Hypoxemia	Settings	P_aCO_2	A-a DO_2	Oxygen Therapy	Ventilation, BiPAP and PEEP	Improved Cardiac Output
1. Low F_iO_2	Postop, high altitude	N or ↓	N	Improves	No change	No change
2. Hypoventilation	Drug overdose	↑	N	Improves	Improves with ventilation	No change
3a. Shunt	ARDS, pneumonia	N or ↓	↑	No change	Improves (except if one-sided)	Improves
3b. Shunt (Right to Left)	Pulmonary HTN	N or ↓	↑	No change	Worsens	Worsens
4. Low Mixed Venous O_2 Content	Shock	↓	↑	Improves or no change	Worsens	Improves
5. V/Q Mismatch	COPD	N or ↑	↑	Improves (small amounts)	Often improves	Improves
6. Diffusion Impairment	ILD, emphysema	N	↑	Improves	Improves with positive pressure	No change or worsens

Reprinted with permission from Dr. Ian Fraser

Hypercapnic Respiratory Failure

- P_aCO_2 increased, P_aO_2 decreased

Pathophysiology

- increased CO_2 production: fever, sepsis, seizure, acidosis, carbohydrate load
- alveolar hypoventilation: COPD, asthma, CF, chest wall disorder, dead space ventilation (rapid shallow breathing)
 - inefficient gas exchange results in inadequate CO_2 removal in spite of normal or increased minute volume
- hypoventilation
 - central: brainstem stroke, hypothyroidism, severe metabolic alkalosis, drugs (opiates, benzodiazepines)
 - neuromuscular: myasthenia gravis, Guillain-Barré, phrenic nerve injury, muscular dystrophy, polymyositis, kyphoscoliosis
 - muscle fatigue

Treatment

- reverse the underlying pathology
- if $P_aCO_2 > 50$ mmHg and pH is acidemic consider noninvasive or mechanical ventilation
- correct exacerbating factors
 - NTT/ETT suction: clearance of secretions
 - bronchodilators: reduction of airway resistance
 - antibiotics: treatment of infections
- maintain oxygenation (see above)
- diet: increased carbohydrate can increase P_aCO_2 in those with mechanical or limited alveolar ventilation; high lipids decrease P_aCO_2

Dead Space

- Ventilation without perfusion
- The opposite of shunt

Causes of Hypercapnia

- High Inspired CO_2
- Low Total Ventilation
- High Deadspace Ventilation
- High CO_2 Production

In chronic hypercapnia, supplemental O_2 may decrease the hypoxic drive to breathe, but do not deny oxygen if the patient is hypoxic

In COPD patients with chronic hypercapnia (" CO_2 retainers"), provide supplemental oxygen to achieve target SaO_2 from 88-92%

Acute Respiratory Distress Syndrome

- clinical syndrome characterized by severe respiratory distress, hypoxemia, and noncardiogenic pulmonary edema
- The Berlin Criteria (*JAMA* 2012; 307:2526-2533) for ARDS
 - acute onset
 - within 7 d of a defined event, such as sepsis, pneumonia, or patient noticing worsening of respiratory symptoms
 - usually occurs within 72 h of presumed trigger
 - bilateral opacities consistent with pulmonary edema on either CT or CXR
 - not *fully* explained by cardiac failure/fluid overload, but patient may have concurrent heart failure
 - objective assessment of cardiac function (e.g. echocardiogram) should be performed even if no clear risk factors

Etiology

- direct lung injury
 - airway: aspiration (**gastric contents**, drowning), **pneumonia**, inhalation injury (oxygen toxicity, nitrogen dioxide, smoke)
 - circulation: embolism (fat, amniotic fluid), reperfusion injury
- indirect lung injury
 - circulation: **sepsis, shock, trauma**, blood transfusion, pancreatitis
 - neurogenic: head trauma, intracranial hemorrhage, drug overdose (narcotics, sedatives, TCAs)

Pathophysiology

- disruption of alveolar capillary membranes → leaky capillaries → interstitial and alveolar pulmonary edema → reduced compliance, V/Q mismatch, shunt, hypoxemia, pulmonary HTN

Clinical Course

A. Exudative Phase

- first 7 d of illness after exposure to ARDS precipitant
- alveolar capillary endothelial cells and type I pneumocytes are injured, resulting in loss of normally tight alveolar barrier
- patients develop dyspnea, tachypnea, increased work of breathing
 - these result in respiratory fatigue and eventually respiratory failure (see *Hypoxemic Respiratory Failure*, R26)

B. Fibroproliferative Phase

- after day 7
- may still experience dyspnea, tachypnea, fatigue, and hypoxemia
- most patients clinically improve and are able to wean off mechanical ventilation
- some patients develop fibrotic lung changes that may require long-term support on supplemental oxygen or even mechanical ventilation
- if fibrosis present, associated with increased mortality

Treatment

- based on ARDS network (see *Landmark Respiriology Trials*, R36)
- treat underlying disorder (e.g. antibiotics if infection present)
- mechanical ventilation using low tidal volumes (<6 mL/kg) to prevent barotrauma
 - use optimal amount of PEEP (positive end-expiratory pressure) to keep airways open and allow the use of lower F_iO_2
 - may consider using prone ventilation, and/or inhaled nitric oxide, high frequency oscillator or ECMO (extracorporeal membrane oxygenation) if conventional treatment is failing
- fluids and inotropic therapy (e.g. dopamine, vasopressin) if cardiac output inadequate
- pulmonary-arterial catheter now seldom used for monitoring hemodynamics
- mortality: 30-40%, usually due to non-pulmonary complications
- sequelae of ARDS include residual pulmonary impairment, severe debilitation, polyneuropathy and psychologic difficulties, which gradually improve over time
- most survivors eventually regain near-normal lung function, often with mildly reduced diffusion capacity

ALI vs. ARDS: Definition is the same, except ALI is a $P_aO_2/F_iO_2 \leq 300$, while ARDS is a $P_aO_2/F_iO_2 \leq 200$

Categorization of ARDS as Mild, Moderate or Severe – The Berlin Criteria

ARDS Severity	P_aO_2/F_iO_2 * (mmHg)	Mortality (95% CI)†
Mild	200-300	27 (24-30)%
Moderate	100-200	32 (29-34)%
Severe	< 100	45 (42-48)%

*on ≥ 5 cm H_2O PEEP, †P < 0.001

JAMA 2012;307:2526-2533

Risk Factors for Aspiration Pneumonia

Categories	Examples
Decreased level of consciousness	Alcoholism
Upper GI tract disorders	Dysphagia, esophageal disorders
Mechanical instrumentation	Intubation, nasogastric tube, feeding tubes
Neurologic conditions	Dementia, Parkinson disease
Others	Protracted vomiting

Neoplasms

Lung Cancer

Classification

- lung tumours can be classified as primary or secondary, benign or malignant, endobronchial or parenchymal
- bronchogenic carcinoma (epithelial lung tumours) are the most common type of primary lung tumour (other types make up less than 1%)
 - small cell lung cancer (SCLC): 10-15%
 - non-small-cell lung cancer (NSCLC): 85-90%
 - squamous cell carcinoma: arise from the proximal respiratory epithelium
 - adenocarcinoma: incidence is increasing; most common subtype in nonsmokers
 - bronchoalveolar carcinoma: grows along the alveolar wall in the periphery; may arise at sites of previous lung scarring
 - large cell undifferentiated cancer: diagnosis of exclusion
- benign epithelial lung tumours can be classified as papillomas or adenomas

Table 28. Characteristics of Bronchogenic Cancer

Cell Type	Incidence	Correlation with Smoking	Location	Histology	Metastasis	5 Yr Survival Rates
SCLC	10-15%	Strong	Central	Oat cell, neuroendocrine	Disseminated at presentation Origin in endobronchial cells	1% (poorest prognosis)
Adenocarcinoma	M: 35% F: 40%	Weak	Peripheral	Glandular, mucin producing	Early, distant	12% (60% for bronchoalveolar carcinoma, a subtype, with a resectable solitary lesion)
Squamous Cell Carcinoma (SCC)	30%	Strong	Central	Keratin, intercellular bridges	Local invasion and distant spread, may cavitate	25%
Large Cell Carcinoma	10-15%	Strong	Peripheral	Anaplastic, undifferentiated	Early, distant	13%

Risk Factors

- cigarette smoking: the relative risk of developing lung cancer is 10-30 times higher for smokers than for nonsmokers
- other risk factors include cigar smoking, pipe smoking, second-hand smoke, asbestos without smoking (relative risk is 5), asbestos with smoking (relative risk is 92), metals (e.g. chromium, arsenic, nickel), radon gas, ionizing radiation, genetics

Signs and Symptoms

- may be due to primary lesion, metastasis, or paraneoplastic syndrome
- primary lesion
 - cough (75%): beware of chronic cough that changes in character
 - dyspnea (60%)
 - chest pain (45%)
 - hemoptysis (35%)
 - other pain (25%)
 - clubbing (21%)
 - constitutional symptoms: anorexia, weight loss, fever, anemia
- metastasis
 - lung, hilum, mediastinum, pleura: pleural effusion, atelectasis, wheezing
 - pericardium: pericarditis, pericardial tamponade
 - esophageal compression: dysphagia
 - phrenic nerve: paralyzed diaphragm
 - recurrent laryngeal nerve: hoarseness
 - superior vena cava syndrome:
 - obstruction of SVC causing neck and facial swelling, as well as dyspnea and cough
 - other symptoms: hoarseness, tongue swelling, epistaxis, and hemoptysis
 - physical findings: dilated neck veins, increased number of collateral veins covering the anterior chest wall, cyanosis, edema of the face, arms, and chest, Pemberton's sign (facial flushing, cyanosis, and distension of neck veins upon raising both arms above head)
 - milder symptoms if obstruction is above the azygos vein
 - lung apex (Pancoast tumour): Horner's syndrome, brachial plexus palsy (most commonly C8 and T1 nerve roots)
 - rib and vertebrae: erosion
 - distant metastasis to brain, bone, liver, adrenals
- paraneoplastic syndromes
 - a group of disorders associated with malignant disease, not related to the physical effects of the tumour itself
 - most often associated with SCLC

Summary of Recommendations on Screening for Lung Cancer

American College of Chest Physicians (2013)

Screening with CXR

Not recommended

Screening with low-dose CT

Recommended for high-risk patients (current or former smokers quit within last 15 yr, aged 55-74, ≥30 pack yr smoking Hx)

American Lung Association (2013)

Screening with CXR

Not recommended

Screening with low-dose CT

Recommended for high-risk patients (current or former smokers aged 55-74, ≥30 pack yr smoking Hx, no Hx of lung cancer)

Reduced Lung Cancer Mortality with Low-Dose CT Screening

NEJM 2011;365:395-409

Study: Multicentre, RCT.

Methods: 53,454 participants at high risk for lung cancer (55-74 yr, >30 yr smoking, and smoking cessation for <5 y) were assigned to undergo three annual screenings with either low dose CT or single-view PA CXR.

Results: A relative reduction in mortality from lung cancer with low-dose CT screening of 20.0% (95% CI 6.8-26.7; p=0.004). Rate of death from any cause was reduced in the low-dose CT group as compared to the CXR group by 6.7% (95% CI 1.2-13.6; p=0.02).

	Low-dose CT	CXR
Rate of positive screening test	24.2%	6.9%
False positives	96.4%	94.5%
Incidence of lung cancer	645/100 K person yr	572/100 K person yr
Deaths from lung cancer	247/100 K person yr	309/100 K person yr

Conclusions: Screening with low-dose CT reduces mortality from lung cancer.

Horner has a MAP of the Coast

A Pancoast tumour compresses the cervical sympathetic plexus causing a Horner's syndrome:

Miosis
Anhidrosis
Ptosis

Table 29. Paraneoplastic Syndromes

System	Clinical Presentation	Associated Malignancy
Skeletal	Clubbing, hypertrophic pulmonary osteoarthropathy (HPOA)	NSCLC
Dermatologic	Acanthosis nigricans Dermatomyositis	Bronchogenic cancer Bronchogenic cancer
Endocrine	Hypercalcemia (osteolysis or PTHrP) Hypophosphatemia Hypoglycemia Cushing's syndrome (ACTH) Somatostatinoma syndrome SIADH	Squamous cell cancer Squamous cell cancer Sarcoma SCLC Bronchial carcinoid SCLC
Neuromyopathic	Lambert-Eaton syndrome Polymyositis Subacute cerebellar degeneration Spinocerebellar degeneration Peripheral neuropathy	SCLC
Vascular/ Hematologic	Nonbacterial endocarditis Trousseau's syndrome (migratory thrombophlebitis) DIC	Bronchogenic cancer NSCLC
Renal	Nephrotic syndrome	

Investigations

- initial diagnosis
 - imaging: CXR, CT chest + upper abdomen, PET scan, bone scan
 - cytology: sputum
 - biopsy: bronchoscopy, EBUS, CT-guided percutaneous needle biopsy, mediastinoscopy
- staging workup
 - TMN staging system: T – primary tumour (size); N – regional lymph nodes; M – distant metastasis
 - blood work: electrolytes, LFTs, calcium, ALP
 - imaging: CXR, CT thorax and upper abdomen, bone scan, neuroimaging
 - invasive: bronchoscopy (EBUS), mediastinoscopy, mediastinotomy, thoracotomy
 - screen adenocarcinoma for EGFR and ALK mutations

Table 30. SCLC vs. NSCLC

	Stage	Definition	Treatment	Median Survival
SCLC	Limited stage	Confined to single radiation port (one hemithorax and regional lymph nodes)	Radiation ± chemotherapy ± prophylactic to brain	1-2 yr (12 wk without treatment)
	Extensive stage	Extension beyond a single radiation port	Chemotherapy	6 mo (5 wk without treatment)
	Stage	TNM	Treatment	5 Yr Survival (%)*
NSCLC	IA	T1a-1bN0M0	1st line is complete surgical resection	50-73
	IB	T2aN0M0	with possible post-operative adjuvant chemotherapy with stage IB and stage II; radiotherapy for non-surgical candidates	43-58
	IIA	T1a-T2a,N1M0 or T2bN0M0		36-46
	IIB	T2bN1M0 or T3N0M0		25-36
	IIIA	T1a-T2bN2M0 or T3N1-2M0 or T4N0-1M0	Combined modality approach (concurrent chemotherapy followed by surgery)	19-24
	IIIB	T4N2M0 or T1-4N3M0		7-9
	IV	T1-4N0-3M1a-1b	Systemic therapy or molecularly targeted therapy or symptom-based palliative management (radiation); isolated metastasis may be resected	2-13

* Depends on clinical vs. pathologic stage

Refer to AJCC Cancer Staging Manual, 7th ed. 2010 for complete TNM classification

Treatment

- options include surgery, radiotherapy, chemotherapy, and palliative care for end-stage disease
- surgery not usually performed for SCLC since it is generally non-curable
- contraindications for surgery
 - spread to contralateral lymph nodes or distant sites
 - patients with potentially resectable disease must undergo mediastinal node sampling since CT thorax is not accurate in 20-40% of cases
 - poor pulmonary status (e.g. unable to tolerate resection of lung)

Malignant lung tumours are the most common cause of cancer mortality throughout the world in both men and women

Endobronchial Ultrasound (EBUS)

- Allows visualization of peri-bronchial structures and distal peripheral lung lesions
- Provides detailed assessment of the airway wall layers
- Allows for guided biopsies of lymph nodes and tumours
- Used for diagnosis and staging

2/3 of primary lung cancer is found in the upper lung; 2/3 of metastases occur in the lower lung (hematogenous spread secondary to increased blood flow to the base of the lung)

Prevention

- Smoking cessation
- Avoidance of exposures
- Early detection

- chemotherapy (used in combination with other treatments)
 - common agents: etoposide, platinum agents (e.g. cisplatin), ifosfamide, vincristine, anthracyclines, paclitaxel, irinotecan, gefitinib (an endothelial growth factor receptor inhibitor)
 - complications
 - acute: tumour lysis syndrome, infection, bleeding, myelosuppression, hemorrhagic cystitis (cyclophosphamide), cardiotoxicity (doxorubicin), renal toxicity (cisplatin), peripheral neuropathy (vincristine)
 - chronic: neurologic damage, leukemia, additional primary neoplasms

Approach to the Solitary Pulmonary Nodule

- see [Medical Imaging](#), MI7

Definition

- a round or oval, sharply circumscribed radiographic lesion up to 3-4 cm, which may or may not be calcified, and is surrounded by normal lung
- can be benign or malignant

Table 31. Differential Diagnosis for Benign vs. Malignant Solitary Nodule

Benign (70%)	Malignant (30%)
Infectious granuloma (histoplasmosis, coccidiomycosis, TB, atypical mycobacteria)	Bronchogenic carcinoma
Other infections (bacterial abscess, PCP, aspergilloma)	Adenocarcinoma
Benign neoplasms (hamartoma, lipoma, fibroma)	Squamous cell carcinoma
Vascular (AV malformation, pulmonary varix)	Large cell carcinoma
Developmental (bronchogenic cyst)	Small cell carcinoma
Inflammatory (granulomatosis with polyangiitis, rheumatoid nodule, sarcoidosis)	Metastatic lesions
Other (infarct, pseudotumour, rounded atelectasis, lymph nodes, amyloidoma)	Breast
	Head and neck
	Melanoma
	Colon
	Kidney
	Sarcoma
	Germ cell tumours
	Pulmonary carcinoid

Investigations

- CXR: always compare with previous CXR
- CT densitometry and contrast enhanced CT of thorax
- sputum cytology: usually poor yield
- biopsy (bronchoscopic or percutaneous) or excision (thoracoscopy or thoracotomy): if clinical and radiographic features do not help distinguish between benign or malignant lesion
 - if at risk for lung cancer, biopsy may be performed regardless of radiographic features
 - if a biopsy is non-diagnostic, whether to observe, re-biopsy, or resect will depend on the level of suspicion
- watchful waiting: repeat CXR and/or CT scan at 3, 6, 12 mo
- PET scan can help distinguish benign from malignant nodules

Table 32. CXR Characteristics of Benign vs. Malignant Solitary Nodule

Parameters	Benign	Malignant
Size	<3 cm, round, regular	>3 cm, irregular, spiculated
Margins	Smooth margin	Ill-defined or notched margin
Features	Calcified pattern: central, "popcorn" pattern if hamartoma, usually no cavitation; if cavitating, wall is smooth and thin, no other lung pathology	Usually not calcified; if calcified, pattern is eccentric, no satellite lesions, cavitation with thick wall, may have pleural effusions, lymphadenopathy
Doubling Time	Doubles in <1 mo or >2 yr	Doubles in >1 mo or <2 yr

Terminology

- "nodule" <3 cm
- "mass" >3 cm

Hamartomas

- 10% of benign lung lesions
- Composed of tissues normally present in lung (fat, epithelium, fibrous tissue, and cartilage), but they exhibit disorganized growth
- Peak incidence is age 60, more common in men
- Usually peripheral and clinically silent
- CXR shows clustered "popcorn" pattern of calcification (pathognomonic for hamartoma)

Pulmonary neoplasms may present as a solitary pulmonary nodule identified incidentally on a radiographic study (~10% of cases) or as symptomatic disease (most cases)

Adenocarcinoma present in a non-smoker may be due to endothelial growth factor receptor mutation

Corona Radiata Sign on Chest CT

- Fine striations that extend linearly from a nodule in a spiculated fashion
- Highly associated with malignancy

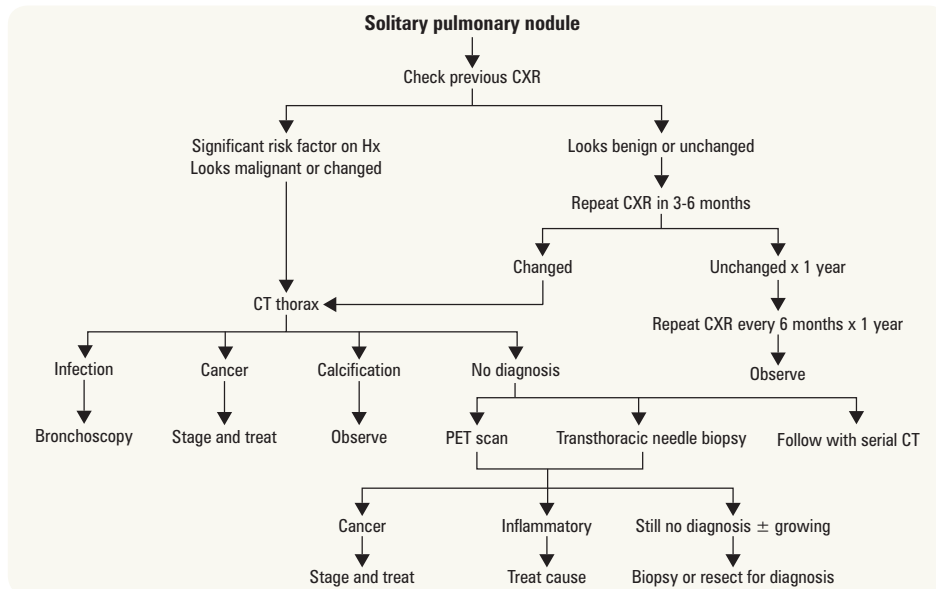

Figure 12. Evaluation of a solitary pulmonary nodule

Carcinoids

- Early onset (40-60 yr)
- Most are central and can produce symptoms and signs of bronchial obstruction
- Hemoptysis is present in ~50% of cases

Sleep-Related Breathing Disorders

Hypoventilation Syndromes

- primary alveolar hypoventilation: idiopathic
- obesity-hypoventilation syndrome (Pickwickian syndrome)
- respiratory neuromuscular disorders

Sleep Apnea

Definition

- episodic decreases in airflow during sleep
- quantitatively measured by the Apnea/Hypopnea Index (AHI) = # of apneic and hypopneic events per hour of sleep
- sleep apnea generally accepted to be present if AHI >15

Classification

- obstructive (OSA)
 - caused by transient, episodic obstruction of the upper airway
 - absent or reduced airflow despite persistent respiratory effort
- central (CSA) (see [Neurology](#), N49)
 - caused by transient, episodic decreases in CNS drive to breathe
 - no airflow because no respiratory effort
 - Cheyne-Stokes Respiration: a form of CSA in which central apneas alternate with hyperpneas to produce a crescendo-decrescendo pattern of tidal volume; seen in severe LV dysfunction, brain injury, and other settings (see Figure 2)
- mixed (MSA)
 - features of both OSA and CSA
 - loss of hypoxic and hypercapnic drives to breathe secondary to “resuscitative breathing”: overcompensatory hyperventilation upon awakening from OSA induced hypoxia

Risk Factors

- for OSA: obesity, upper airway abnormality, neuromuscular disease, hypothyroidism, alcohol/sedative use, nasal congestion, sleep deprivation
- for CSA: LV failure, brainstem lesions, encephalitis, encephalopathy, myxedema, high altitude

Signs and Symptoms

- obtain history from spouse/partner
- secondary to repeated arousals and fragmentation of sleep: daytime somnolence, personality and cognitive changes, snoring
- secondary to hypoxemia and hypercapnia: morning headache, polycythemia, pulmonary/systemic HTN, cor pulmonale/CHF, nocturnal angina, arrhythmias

Normal Respiratory Changes during Sleep

- Tidal volume decreases
- Arterial CO₂ increases (due to decreased minute ventilation)
- Pharyngeal dilator muscles relax causing increased upper airway resistance

Apnea: absence of breathing for ≥10 s

Hypopnea: excessive decrease in rate or depth of breathing (>50% reduction in ventilation)

Hyperpnea: excessive increase in rate or depth of breathing

- the typical presentation for OSA is a middle-aged obese male who snores
- CSA can be due to neurological disease

Investigations

- sleep study (polysomnography)
 - evaluates sleep stages, airflow, ribcage movement, ECG, SaO₂, limb movements
 - indications
 - ♦ excessive daytime sleepiness
 - ♦ unexplained pulmonary HTN or polycythemia
 - ♦ daytime hypercapnia
 - ♦ titration of optimal nasal CPAP
 - ♦ assessment of objective response to other interventions

Treatment

- modifiable factors: weight loss, decreased alcohol/sedatives, nasal decongestion, treatment of underlying medical conditions
- OSA or MSA: nasal CPAP, postural therapy (e.g. no supine sleeping), dental appliance, uvulopalatopharyngoplasty, tonsillectomy
- CSA or hypoventilation syndromes: nasal BiPAP/CPAP, respiratory stimulants (e.g. progesterone) in select cases
- tracheostomy rarely required and should be used as last resort for OSA

Complications

- depression, weight gain, decreased quality of life, workplace and vehicular accidents, cardiac complications (e.g. HTN), reduced work/social function

CPAP has been shown to reduce cardiovascular risk and cardiovascular related deaths in patients with obstructive sleep apnea

Continuous Positive Airways Pressure for Obstructive Sleep Apnea

Cochrane DB Syst Rev 2006;CD001106

Study: Pooled analysis of 36 RCTs (n=1,718) comparing nocturnal CPAP with an inactive control or oral appliances in adults with OSA.

Conclusions: The use of CPAP showed significant improvements in objective and subjective measures including cognitive function, sleepiness, measures of quality of life, and a lower average systolic and diastolic blood pressure. People who responded equally well to CPAP and oral appliances expressed a strong preference for oral appliances; however, participants on oral appliances were more likely to withdraw from therapy.

Introduction to Intensive Care

- goal is to provide stabilization for critically ill patients: hemodynamic, respiratory or cardiac instability, or need for close monitoring

Intensive Care Unit Basics

Lines and Catheters

- arterial lines
 - monitor beat-to-beat blood pressure variations, obtain blood for routine ABGs
 - common sites are the radial and femoral arteries
- central venous catheter (central line)
 - administer IV fluids, monitor CVP, insert pulmonary artery catheters
 - administer TPN and agents too irritating for peripheral line
 - common sites: internal jugular vein, subclavian vein, femoral vein
- pulmonary arterial catheter
 - balloon guides the catheter from a major vein to the right heart
 - measures pulmonary capillary wedge pressure (PCWP) via a catheter wedged in distal pulmonary artery
 - PCWP reflects the LA and LV diastolic pressure (barring pulmonary venous or mitral valve disease)
 - indications (now used infrequently due to associated complications)
 - ♦ diagnosis of shock states, primary pulmonary HTN, valvular disease, intracardiac shunts, cardiac tamponade, PE
 - ♦ assessment of hemodynamic response to therapies
 - ♦ differentiation of high- versus low-pressure pulmonary edema
 - ♦ management of complicated MI, multiorgan system failure and/or severe burns, or hemodynamic instability after cardiac surgery
 - absolute contraindications
 - ♦ tricuspid or pulmonary valve mechanical prosthesis
 - ♦ right heart mass (thrombus or tumour)
 - ♦ tricuspid or pulmonary valve endocarditis

Table 33. Useful Equations and Cardiopulmonary Parameters

$BSA = [Ht (cm) + Wt (kg) - 60]/100$	$PCWP = LVEDP$
$SV = CO / HR$	$SVI = CI / HR$
$CI = CO / BSA$	$RV \text{ Ejection Fraction} = SV / RVEDV$
$SVRI = [(MAP - RAP) 80]/CI$	$PP = sBP - dBP$
$P:F \text{ ratio} = P_aO_2 / F_iO_2$	$MAP = 1/3 sBP + 2/3 dBP = dBP + 1/3 PP$

BSA = body surface area; CI = cardiac index; CO = cardiac output; dBP = diastolic blood pressure; HR = heart rate; LVEDP = left ventricular end diastolic pressure; MAP = mean arterial pressure; PCWP = pulmonary capillary wedge pressure; PP = pulse pressure; RAP = right atrial pressure; RVEDV = right ventricular end diastolic volume; sBP = systolic blood pressure; SV = stroke volume; SVI = stroke volume index; SVRI = systemic vascular resistance index

Organ Failure

Table 34. Types of Organ Failure

Type of Failure	Clinical Presentation	Treatment
Respiratory Failure (see <i>Respiratory Failure</i> , R26)	Hypoxemia Hypercapnea	Treat underlying cause (e.g. lung disease, shunt, V/Q mismatch, drug-related, cardiac) Manage mechanical ventilation settings Supplemental oxygen
Cardiac Failure (see <i>Cardiology and Cardiac Surgery</i> , C36)	Hypotension Decreased urine output Altered mental status Arrhythmia Hypoxia	Treat underlying cause (e.g. bradycardia, tachycardia, blood loss, adrenal insufficiency) Volume resuscitation Vasopressors Inotropes Intra-aortic balloon pump
Coagulopathy (see <i>Hematology</i> , H32)	Increased INR or PTT Low platelet count Bleeding, bruising	Treat underlying cause (e.g. thrombocytopenia, drug-related, immune-related, DIC) Transfusion of blood products, clotting factors
Liver Failure (see <i>Gastroenterology</i> , G36)	Elevated transaminases, bilirubin Coagulopathy Jaundice Mental alteration (encephalopathy) Hypoglycemia	Treat underlying cause (e.g. viral hepatitis, drug related, metabolic) Liver transplant Lactulose
Renal Failure (see <i>Nephrology</i> , NP17)	Elevated creatinine Reduced urine output Signs of volume overload (e.g. CHF, effusions)	Treat underlying cause (e.g. shock, drug-related, obstruction) Correct volume and electrolyte status, eliminate toxins Diuretics Dialysis

Intensive Insulin Therapy in Critically Ill Patients *NEJM* 2001;345:1359-1367

Study: Prospective, randomized controlled clinical outcome study.

Patients: 1,548 patients admitted to the ICU.

Intervention: At admission, patients were randomly assigned to either intensive insulin therapy or conventional therapy. Those in the intensive group had an infusion started if BG exceeded 6.1 mmol/L, and maintained to keep BG between 4.4-6.1 mmol/L. Those in the conventional group were started on insulin only if BG exceeded 11.9, and the infusion was adjusted for a target between 10.0 and 11.1 mmol/L.

Primary Outcome: Death from any cause during ICU stay.

Results: 35 patients (4.6%) died in the intensive group in the ICU, vs. 63 patients (8.0%) in the conventional group. This represents a 32% mortality reduction ($p=0.04$). Intensive insulin therapy also reduced overall in-hospital mortality, lowered deaths due to sepsis, multi-organ failure. Most of the mortality benefit was seen in long stay patients (>5 d).

Conclusion: Intensive insulin therapy in the ICU reduces mortality by 32%, and improves in-hospital mortality and morbidity.

Shock

- see [Emergency Medicine](#), ER3
- inadequate tissue perfusion potentially resulting in end organ injury
 - categories of shock
 - hypovolemic: hemorrhage, dehydration, vomiting, diarrhea, interstitial fluid redistribution
 - cardiogenic: myopathic (myocardial ischemia \pm infarction), mechanical, arrhythmic, pharmacologic
 - obstructive: massive PE (saddle embolus), pericardial tamponade, constrictive pericarditis, increased intrathoracic pressure (e.g. tension pneumothorax)
 - distributive: sepsis, anaphylactic reaction, neurogenic, endocrinologic, toxic

Table 35. Changes Seen in Different Classes of Shock

	Hypovolemic	Cardiogenic	Obstructive	Distributive
HR	\uparrow	\uparrow , N, or \downarrow	\uparrow	\uparrow or \downarrow
BP	\downarrow	\downarrow	\downarrow	\downarrow
JVP	\downarrow	\uparrow	\uparrow	\downarrow
Extremities	Cold	Cold	N or Cold	Warm
Other	Look for visible hemorrhage or signs of dehydration	Bilateral crackles on chest exam	Depending on cause, may see pulsus paradoxus, Kussmaul's sign, or tracheal deviation	Look for obvious signs of infection or anaphylaxis

- treat underlying cause
- treatment goal is to return critical organ perfusion to normal (e.g. normalize BP)
- common treatment modalities include
 - fluid resuscitation
 - inotropes (e.g. dobutamine), vasopressors (e.g. norepinephrine), vasopressin
 - revascularization or thrombolytics for ischemic events

Sepsis

- the leading cause of death in noncoronary ICU settings is multi-organ failure due to sepsis
- the predominant theory is that sepsis is attributable to uncontrollable immune system activation

Definitions

- sepsis: the presence of both infection and SIRS (see [Table 36](#))
- severe sepsis: sepsis associated with organ dysfunction, hypoperfusion or hypotension
- septic shock: sepsis with arterial hypotension despite adequate fluid resuscitation

Shock: Clinical Correlation

Hypovolemic: patients have cool extremities due to peripheral vasoconstriction

Cardiogenic: patients usually have signs of left-sided heart failure

Obstructive: varied presentation

Distributive: patients have warm extremities due to peripheral vasodilation

Causes of SHOCK

Spinal (neurogenic), Septic

Hemorrhagic

Obstructive (e.g. tension pneumothorax, cardiac tamponade, PE)

Cardiogenic (e.g. arrhythmia, MI)

Anaphylactic

Systemic Inflammatory Response Syndrome (SIRS): generalized inflammatory reaction caused by infectious and noninfectious entities, manifested by two or more of:

- Body temperature $>38^{\circ}\text{C}$ or $<36^{\circ}\text{C}$
- Heart rate $>90/\text{min}$
- Respiratory rate $>20/\text{min}$ or $\text{PaCO}_2 <32 \text{ mmHg}$
- WBC $>12,000 \text{ cells/mL}$ or $<4,000 \text{ cells/mL}$ or $>10\%$ bands

- multiorgan dysfunction syndrome: sepsis in the presence of altered organ function such that homeostasis cannot be maintained without intervention

Signs and Symptoms

Table 36. Clinical Manifestations of Sepsis

General Variables	Organ Dysfunction Variables
Fever ($>38^{\circ}\text{C}$) or hypothermia ($<36^{\circ}\text{C}$)	Arterial hypoxemia ($\text{P}_a\text{O}_2/\text{F}_i\text{O}_2 < 300$)
Heart rate $>90/\text{min}$	Acute oliguria (urine output $<0.5 \text{ mL/kg/h}$)
sBP $<90 \text{ mmHg}$, MAP <70 , or a sBP decrease $>40 \text{ mmHg}$	Creatinine increase $>40 \mu\text{mol/L}$
Tachypnea	Coagulation abnormalities (INR >1.5 or aPTT $>60 \text{ s}$)
Altered mental status	Ileus (absent bowel sounds)
Positive fluid balance ($>20 \text{ mL/kg}$ over 24 h)	Thrombocytopenia (platelet count $<100,000/\text{L}$)
Hyperglycemia (BG $>7.7 \text{ mmol/L}$) in the absence of diabetes	Hyperbilirubinemia (plasma total bilirubin $>70 \text{ mmol/L}$)
Leukopenia (WBC $<4,000/\text{L}$)	Leukocytosis (WBC $>12,000/\text{L}$)
Normal WBC count with $>10\%$ immature forms	
Plasma C-reactive protein $>2 \text{ SD}$ above the normal value	Tissue Perfusion Variables
	Hyperlactatemia ($>1 \text{ mmol/L}$)
	Decreased capillary refill or mottling

Table adapted with permission from Levy MM, Fink MP, Marshall JC, et al. 2001 SCCM/ESICM/ACCP/ATS/SIS International Sepsis Definitions Conference. *Critical Care Medicine* 2003;31:1250-1256

Treatment

- identify the cause and source of infection: blood, sputum, urine Gram stain, and C&S
- initiate empiric antibiotic therapy
- monitor, restore, and maintain hemodynamic function

Early Goal Directed Therapy

- adjustments of cardiac preload, afterload, and contractility to balance oxygen delivery with demand
- should be started immediately and completed within 6 h of recognition of severe sepsis or septic shock
- patient should meet SIRS criteria and sBP $<90 \text{ mmHg}$ or lactate $>4 \text{ mmol/L}$
 1. supplemental oxygen \pm intubation and mechanical ventilation
 2. central venous and arterial catheterization
 3. maintain CVP 8-12 mmHg with IV crystalloids/colloids
 4. MAP maintained 65-90 mmHg with the use of vasoactive agents
 5. $\text{S}_{\text{cv}}\text{O}_2 <70\%$ then
 - ♦ transfusion of red cells until Hct $>30\%$
 - ♦ if $\text{S}_{\text{cv}}\text{O}_2 <70\%$ after transfusion then use inotropic agents
- supportive oxygenation and ventilation using lung-protective regimen
- early nutritional support: enteral route is used to preserve function of intestinal mucosal barrier
- control hyperglycemia with insulin to decrease infectious complications
- physiologic dose corticosteroid replacement therapy in patients with relative adrenal insufficiency (nonresponders to corticotropin stimulation test)
 - consider in mechanically ventilated septic shock patients with organ dysfunction requiring vasopressors, despite early goal-directed therapy and appropriate antibiotic therapy
- recombinant activated protein C may be considered in patients with severe sepsis or septic shock with an APACHE II score >25 despite early goal-directed therapy and appropriate antibiotic therapy
- DVT/PE prophylaxis
- advanced care planning, including the communication of likely outcomes and realistic goals of treatment with patients and families

Corticosteroids for Treating Severe Sepsis and Septic Shock

Cochrane DB Syst Rev 2010;CD002243

Study: Meta-analysis of 25 RCTs and quasi-RCTs examining the efficacy of corticosteroids on death at one month in patients with severe sepsis and septic shock.

Results: Overall, there was no difference in 28-d all-cause mortality but there was significant heterogeneity in dosing strategy between the studies. Treatment with long course of low dose corticosteroids significantly reduced 28-d mortality, increased the proportion of shock reversal by day 7 and day 28, reduced the sepsis-related organ failure assessment score by day 7, and survivors' length of stay in the ICU, without inducing gastrointestinal bleeding, superinfection, or neuromuscular weakness. Corticosteroids increased the risk of hyperglycemia and hypernatremia.

Conclusions: Corticosteroids did not change mortality in severe sepsis and septic shock. A long course of low dose corticosteroids reduced 28-d mortality without major complications.

Common Medications

Table 37. Common Medications for Respiratory Diseases

	Drug	Typical Adult Dose	Indications	Side Effects
β₂-AGONISTS				
Short-Acting	salbutamol/albuterol (Ventolin®) (light blue/navy), terbutaline (Bricanyl®)	1-2 puffs q4-6h prn	Bronchodilator in acute reversible airway obstruction	CV (angina, flushing, palpitations, tachycardia, can precipitate atrial fibrillation), CNS (dizziness, H/A, insomnia, anxiety), GI (diarrhea, N/V), rash, hypokalemia, paroxysmal bronchospasm
Long-Acting	salmeterol (Serevent®), formoterol (Oxeze®), indacaterol (Onbrez®)	1-2 puffs bid 1 puff daily	Maintenance treatment (prevention of bronchospasm) in COPD, asthma	
Combination Long-Acting β₂-Agonist and Inhaled Corticosteroid	fluticasone and salmeterol (Advair®) (purple MDI or diskus) Budesonide and formoterol (Symbicort®) (red turbuhaler) Mometasone and formoterol (Zenhale®) (blue MDI)	1 puff bid 2 puffs bid	COPD and asthma	Common: CNS, H/A, dizziness Resp: URTI, GI (N/V, diarrhea, pain/discomfort, oral candidiasis)
ANTICHOLINERGICS				
	ipratropium bromide (Atrovent®) (clear/green), tiotropium bromide (Spiriva®), glycopyrronium bromide	2-3 puffs qid 1 puff qam 1 puff daily	Bronchodilator used in COPD, bronchitis and emphysema	Palpitations, anxiety, dizziness, fatigue, H/A, N/V, dry mucous membranes, urinary retention, increased toxicity in combination with other anticholinergic drugs
CORTICOSTEROIDS				
Inhaled	fluticasone (Flovent®) (orange/peach) budesonide (Pulmicort®) ciclesonide (Alvesco®) beclomethasone (QVAR®; Vanceril®) Mometasone (Asmanex®)	2-4 puffs bid 2 puffs bid 1-4 puffs OD 1-4 puffs bid (40 µg), 1-2 puffs bid (80 µg) 1 puff daily or bid	Maintenance treatment of asthma	H/A, fever, N/V, MSK pain, URTI, throat irritation, growth velocity reduction in children/adolescents, HPA axis suppression, increased pneumonia risk in COPD
Systemic	prednisone (Apo-prednisone®, Deltasone®) methylprednisolone (Depo-Medrol®, Solu-Medrol®)	Typically 40-60 mg per day PO 125 mg q8h IV (sodium succinate) loading dose 2 mg/kg then 0.5-1 mg/kg q6h for 5 d	Acute exacerbation of COPD; severe, persistent asthma, PCP Status asthmaticus	Endocrine (hirsutism, DM/glucose intolerance, Cushing's syndrome, HPA axis suppression), GI (increased appetite, indigestion), ocular (cataracts, glaucoma), edema, AVN, osteoporosis, H/A, psychiatric (anxiety, insomnia), easy bruising
ADJUNCT AGENTS				
	theophylline (Uniphyll®)	400-600 mg OD	Treatment of symptoms of reversible airway obstruction due to COPD	GI upset, diarrhea, N/V, anxiety, H/A, insomnia, muscle cramp, tremor, tachycardia, PVCs, arrhythmias Toxicity: persistent, repetitive vomiting, seizures
LEUKOTRIENE ANTAGONISTS				
	montelukast (Singular®) zafirlukast (Accolate®)	10 mg PO qhs, now only available as once daily slow release 20 mg bid	Prophylaxis and chronic treatment of asthma	H/A, dizziness, fatigue, fever, rash, dyspepsia, cough, flu-like symptoms
MONOCLONAL ANTIBODIES				
	omalizumab (Xolair®)	150-375 mg SC q2-4wk	Moderate-severe persistent asthma	H/A, sinusitis, pharyngitis, URTI, viral infection, thrombocytopenia, anaphylaxis
PDE5 INHIBITORS				
	roflumilast (Daxas®)	500 µg PO OD	Severe emphysema, with frequent exacerbations	Weight loss, suicidal ideation
ANTIBIOTICS – COMMUNITY ACQUIRED PNEUMONIA				
Macrolide	erythromycin azithromycin clarithromycin	250-500 mg PO tid x 7-10 d 500 mg PO x 1 dose, then 250 mg OD x 4 1,000 mg od or 500 mg PO bid x 7-10 d	Alternate to doxycycline or fluoroquinolone	GI (abdominal pain, diarrhea, N/V), H/A, prolonged QT, ventricular arrhythmias, hepatic impairment GI (diarrhea, N/V, abdominal pain), renal failure, deafness H/A, rash, GI (diarrhea, N/V, abnormal taste, heartburn, abdominal pain), increased urea
Doxycycline		100 mg PO bid x 7-10 d	Alternate to macrolide or fluoroquinolone	Photosensitivity, rash, urticaria, anaphylaxis, diarrhea, enterocolitis, tooth discolouration in children
Fluoroquinolone	levofloxacin (Levaquin®) moxifloxacin (Avelox®)	500 mg PO OD x 7-10 d 400 mg PO OD x 7 d	Alternate to macrolide or doxycycline	CNS (dizziness, fever, H/A), GI (N/V, diarrhea, constipation), prolonged QT

Table 37. Common Medications for Respiratory Diseases (continued)

Drug	Typical Adult Dose	Indications	Side Effects
ANTIBIOTICS – HOSPITAL ACQUIRED PNEUMONIA			
3rd gen Cephalosporin ceftriaxone (Rocephin®)	1-2 g IV OD x 7-10 d	Combine with fluoroquinolone or macrolide	Rash, diarrhea, eosinophilia, thrombocytosis, leukopenia, elevated transaminases
Fluoroquinolone levofloxacin moxifloxacin	750 mg PO OD x 5 d 400 mg PO OD x 7 d (5 d for AECOPD)	Combine with 3rd gen cephalosporin	See above
Piperacillin/Tazobactam (Tazocin®)	4.5 g IV q6-8h x 7-10 d	Suspect Pseudomonas	CNS (confusion, convulsions, drowsiness), rash, Hematologic (abnormal platelet aggregation, prolonged PT, positive Coombs)
Vancomycin (Vancocin®)	1 g IV bid x 7-10 d	Suspect MRSA	CNS (chills, drug fever), hematologic (eosinophilia), rash, red man syndrome, interstitial nephritis, renal failure, ototoxicity
Macrolide azithromycin clarithromycin	500 mg IV OD x 2 d, then 500 mg PO OD x 5 d 1,000 mg od or 500 mg PO bid x 7-10 d	Suspect Legionella	See above See above
ICU MEDICATIONS			
Pressors/Inotropes norepinephrine (Levophed®) phenylephrine dobutamine	0.5-30 µg/min IV 0.5 µg/kg/min IV 2-20 µg/kg/min IV	Acute hypotension Severe hypotension Inotropic support	Angina, bradycardia, dyspnea, hyper/hypotension, arrhythmias See above See above
Sedatives/Analgesia fentanyl (opioid class) propofol (anesthetic)	50-100 µg then 50-unlimited µg/h IV 1-3 mg/kg then 0.3-5 mg/kg/h IV	Sedation and/or analgesia Sedation and/or analgesia	Bradycardia, respiratory depression, drowsiness, hypotension Apnea, bradycardia, hypotension (good for ventilator sedation)

See [Infectious Diseases](#), ID26 – for the management of pulmonary tuberculosis

Landmark Respiriology Trials

Trial	Reference	Results
ARDS Network	<i>NEJM</i> 2000; 342:1301-8	Mortality decreased in ARDS patients ventilated with a low tidal volume strategy
Berlin Criteria	<i>JAMA</i> 2012; 307:2526-33	The new definition of ARDS, better predicts mortality
CPAP and Apnea	<i>NEJM</i> 2005; 353:2025-33	CPAP ameliorates symptoms of sleep apnea but does not affect mortality in CHF
EINSTEIN-PE	<i>NEJM</i> 2012; 366:1287-97	Fixed dose of rivoxabarin was non-inferior to standard therapy (Vit K antagonist) initial and long-term treatment of PE
Emphysema Treatment Trial	<i>NEJM</i> 2003; 348:2059-73	Lung volume reduction surgery benefits patients with upper lobe disease and low exercise capacity
IELCAP	<i>NEJM</i> 2006; 355:1763-71	High survival rate in patients with early stage lung cancer detected by low dose CT screening
Lung Health	<i>JAMA</i> 1994; 272:1497-505	Aggressive smoking intervention significantly decreases the age-related decline in FEV ₁ in middle-aged smokers with mild airways obstruction
OSCILLATE	<i>NEJM</i> 2013; 368: 795-805	Early high-frequency oscillatory ventilation in patients with moderate to severe ARDS might increase in-hospital mortality
Pneumonia	<i>NEJM</i> 1978; 298:801-9	Interstitial lung disease subsets have different prognoses and response to treatment (e.g. desquamative but not usual interstitial pneumonia respond well to corticosteroids)
POET-COPD	<i>NEJM</i> 2011; 364:1093-103	Tiotropium decreases the number of moderate-to-severe exacerbations in comparison to salmeterol
REDUCE	<i>JAMA</i> 2013; 309: 2223-2231	5 d course of glucocorticoids is non-inferior to a 14 d course for treatment of acute COPD exacerbations
ROFLUMILAST	<i>Lancet</i> 2009; 374:695-703	Leukotriene inhibitors improve FEV ₁ when used as add-on therapy in COPD patients on tiotropium or salmeterol
TORCH	<i>NEJM</i> 2007; 356:775-89	Combination of inhaled steroids and long-acting β ₂ -agonists improves COPD symptoms, reduces exacerbations, and shows a trend to lowers mortality
UPLIFT	<i>NEJM</i> 2008; 359:1543-54	Tiotropium improves symptoms of COPD with fewer exacerbations, but does not affect FEV ₁ decline

Acronyms

Ab	antibody	dsDNA	double stranded DNA	PM	polymyositis
ACPA	anti-citrullinated protein antibodies	EA	enteropathic arthritis	PMN	polymorphonuclear leukocyte
Ag	antigen	ECASA	enteric-coated acetylsalicylic acid	PMR	polymyalgia rheumatica
ANA	antinuclear antibody	ESR	erythrocyte sedimentation rate	PsA	psoriatic arthritis
ANCA	antineutrophil cytoplasmic antibody	GC	Neisseria gonorrhoeae/gonococcus	PTT	partial thromboplastin time
Anti-RNP	antinuclear protein	GCA	giant cell arteritis	PUD	peptic ulcer disease
Anti-Sm	anti-Smith antibodies	GPA	granulomatosis with polyangiitis	RA	rheumatoid arthritis
APLA	antiphospholipid antibody syndrome	H/A	headache	RBC	red blood cell
AS	ankylosing spondylitis	Hb	hemoglobin	ReA	reactive arthritis
AVN	avascular necrosis	HLA	human leukocyte antigen	RF	rheumatoid factor
BUN	blood urea nitrogen	IA	intra-articular	ROM	range of motion
CBC	complete blood count	IBD	inflammatory bowel disease	SI	sacroiliac
CCB	calcium channel blocker	IE	infective endocarditis	SLE	systemic lupus erythematosus
CCP	cyclic citrullinated peptide	ILD	interstitial lung disease	SNRI	serotonin-norepinephrine reuptake inhibitors
CMC	carpometacarpal joint	ITP	idiopathic thrombocytopenic purpura	SS	Sjögren's syndrome
CNS	central nervous system	MCP	metacarpal phalangeal joint	SSA	Sjögren's syndrome antigen A
CTD	connective tissue disease	MCTD	mixed connective tissue disease	SSB	Sjögren's syndrome antigen B
CPPD	calcium pyrophosphate dihydrate	MHC	major histocompatibility complex	TNF	tumour necrosis factor
CRP	C-reactive protein	MPO	myeloperoxidase	U/A	urinalysis
DEXA	dual energy X-ray absorptiometry	MTP	metatarsal phalangeal joint	ULN	upper limit of normal
DIP	distal interphalangeal joint	MTX	methotrexate	U-SpA	undifferentiated spondyloarthropathy
DM	diabetes mellitus	OA	osteoarthritis	VDRL	venereal disease research laboratory
DMARD	disease-modifying anti-rheumatic drug	PAN	polyarteritis nodosa	WBC	white blood cell
DMM	dermatomyositis	PIP	proximal interphalangeal joint		

Anatomy of Joint Pathology

Figure 1. Structure of normal, degenerative, and inflammatory joint

Basics of Immunology

Immune Mechanisms of Disease

Table 1. Mechanisms of Immunologically Mediated Disorders

Type	Pathophysiology	Examples
Immediate Hypersensitivity (Type I)	Formation of IgE → release of immunologic mediators from basophils/mast cells → diffuse inflammation	Asthma Allergic rhinitis Anaphylaxis
Cytotoxic (Type II)	Formation of Ab → deposit and bind to Ag on cell surface → phagocytosis or lysis of target cell	Autoimmune hemolytic anemia, Goodpasture's syndrome, Graves' disease, pemphigus vulgaris, rheumatic fever, ITP
Immune Complex (Type III)	Formation and deposition of Ag-Ab complexes → activate complement → leukocyte recruitment and activation → tissue injury	SLE, PAN, post-streptococcal glomerulonephritis, serum sickness, viral hepatitis
Cell-Mediated/Delayed Hypersensitivity (Type IV)	Release of cytokines by sensitized T-cells and T-cell mediated cytotoxicity	Contact dermatitis, insect venom, mycobacterial proteins

Immunogenetics and Disease

- cell surface molecules called HLAs play a role in mediating immune reactions
- MHC are genes on the short arm of chromosome 6 that encode HLA molecules
- certain HLA haplotypes are associated with increased susceptibility to autoimmune diseases

Table 2. Classes of MHCs

MHC Class	Types	Location	Function
I	HLA-A, B, C	All cells	Recognized by CD8+ (cytotoxic) T-lymphocytes
II	HLA-DP, DQ, DR	Ag presenting cells (mononuclear phagocytes, B cells, etc.)	Recognized by CD4+ (helper) T-lymphocytes
III	Some components of the complement cascade	In plasma	Chemotaxis, opsonization, lysis of bacteria and cells

Table 3. HLA-Associated Rheumatic Disease

HLA Type	Associated Conditions	Comments
B27	AS ReA EA	In AS, relative risk = 70-90x In ReA, relative risk = 40x
DR4, DR1	RA	In RA, relative risk = 2-10x; found in 93% of patients
DR3	SS SLE	DR3 associated with many non-rheumatic conditions (celiac disease, type 1 DM, Graves' disease, chronic active hepatitis)

Terminology in Rheumatology

Arthritis

- Joint swelling: effusion/synovial thickening
- Decreased ROM
- Stress pain (pain at the end of ROM)
- Increased warmth

Arthralgia: perception of joint pain without obvious clinical findings

Active Joint: swollen joint, joint line tenderness, or stress pain

Innate Immune Cells

- Neutrophil (PMN):** circulate in blood and respond to inflammatory stimuli, kill invading organisms by phagocytosis, degranulation and neutrophil extracellular traps
- Natural Killer Cell:** innate immunity against intracellular infections (especially viruses), killing function and produce cytokines
- Macrophage:** arrive after PMNs, suppress PMN efflux and phagocytose PMN debris, secrete pro-inflammatory cytokines in response to microbial debris
- Dendritic Cell:** actively phagocytic when immature, activated by signals from toll-like receptor (TLR), release pro-inflammatory cytokines, present antigens to T cells in lymph nodes
- Cosinophil:** respond to inflammatory cytokines and degranulate releasing reactive oxygen species, and cytokines, associated with allergy, asthma and parasitic infection
- Mast Cell:** present in connective tissue and mucosa, allergen cross-linking of IgE bound to mast cell triggers degranulation and release of inflammatory mediators

Adaptive Immune Cells

- B Cell:** produce antibodies after activation by specific antigen and B-cell co-receptor, additional signals provided by CD4 T helper cells
- Cytotoxic T Cell:** CD8, direct cytotoxicity of target cells at sites of infection, kill via lytic granules and FasL-Fas interaction, recognize specific antigen and MHC1
- Helper T Cell:** subset of CD4 cells, activate and help other types of cells carry out immune defense (activate macrophages, help B cells, release cytokines)
- Regulatory T Cell:** Subset of CD4 cells, suppress activation of naïve autoreactive T cells

Key Cytokine Targets of Biologic Drugs

TNF

- Source:** T cells, macrophages
- Major Functions:** cachexia, induces other cytokines, T cell stimulation, induces metalloproteinases and prostaglandins, increases expression of adhesion molecules, increases vascular permeability leading to increased entry of IgG, complement and cells into tissues

IL-6

- Source:** Many cells
- Major Functions:** proliferation of B and T cells, acute phase reactant, induces natural protease inhibitor

Differential Diagnoses of Common Presentations

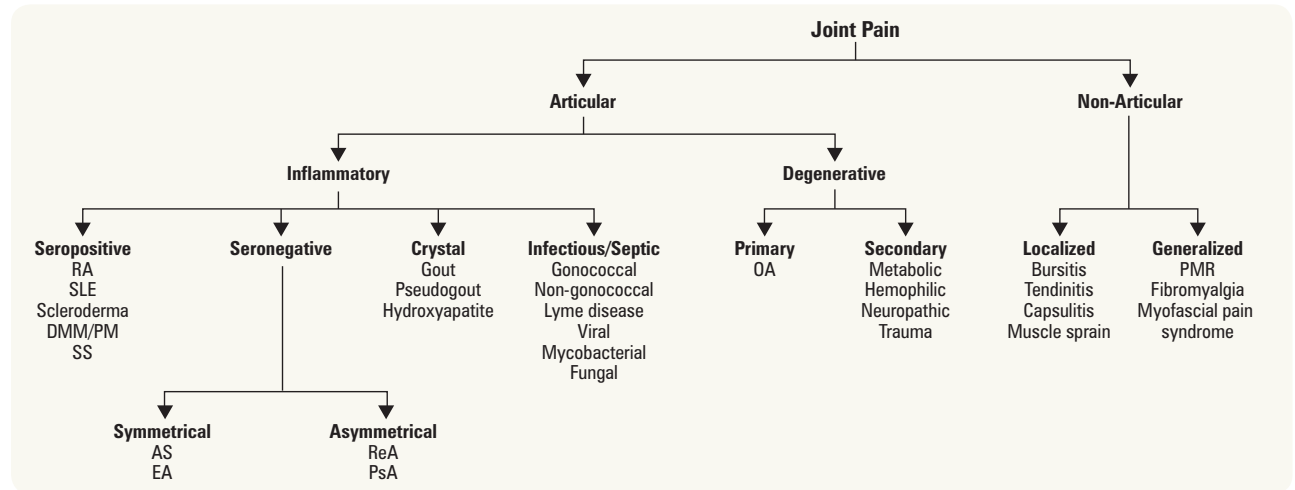

Figure 2. Clinical approach to joint pain

Table 4. Differential Diagnosis of Monoarthritis

Infection	Crystal	Degenerative	Trauma	Neoplastic	Other
Septic arthritis (<i>S. aureus</i> , GC, fungi, TB)	Gout Pseudogout Hydroxyapatite	OA	Hemarthrosis Osteonecrosis	Tumour	Systemic inflammatory disease Polyarthritis presenting with monoarticular symptoms first

Table 5. Differential Diagnosis of Oligoarthritis/Polyarthritis

Acute (<6 wk)	Chronic (>6 wk)		
First presentation or flare of inflammatory arthritis	Seropositive inflammatory arthritis RA SLE Scleroderma DM/PM	Seronegative inflammatory arthritis AS EA PsA ReA Crystal (polyarticular gout)	Degenerative OA
Post-viral (parvovirus B19)			
Acute rheumatic fever			
Infectious (GC, non-GC)			
Gout			
Sarcoidosis			
Lyme disease			
HIV			

Table 6. Symptoms of Inflammatory Arthritis vs. Degenerative Arthritis

Inflammatory	Degenerative
Pain at rest, relieved by motion Morning stiffness >1 h Warmth, swelling, erythema Malalignment/deformity Extra-articular manifestations Nighttime awakening	Pain with motion, relieved by rest Morning stiffness <½ h Joint instability, buckling, locking Bony enlargement, malalignment/deformity Evening pain

Table 7. Seropositive vs. Seronegative Rheumatic Diseases

	Seropositive	Seronegative
Demographics	F>M	M>F
Peripheral Arthritis	Symmetrical Small (PIP, MCP) and medium joints (wrist, knee, ankle, elbow) common DIP less often involved	Usually asymmetrical Usually larger joints, lower extremities (exception: PsA) DIP in PsA Dactylitis ("sausage digit")
Pelvic/Axial Disease	No (except for C-spine)	Yes
Enthesitis	No	Yes
Extra-Articular	Nodules Vasculitis Sicca Raynaud's phenomenon	Iritis (anterior uveitis) Oral ulcers Gastrointestinal Dermatologic features

Causes of Joint Pain

SOFTER TISSUE

Sepsis
OA
Fracture
Tendon/muscle
Epiphyseal
Referred
Tumour
Ischemia
Seropositive arthritides
Seronegative arthritides
Urate (gout)/other crystal
Extra-articular rheumatism (PMR/fibromyalgia)

Patterns of Joint Involvement

- Symmetrical vs. asymmetrical
- Small vs. large
- Mono vs. oligo (2-4 joints) vs. polyarticular (≥5 joints)
- Axial vs. peripheral

The presence of synovitis often indicates articular as opposed to non-articular joint pain; synovitis presents with: soft tissue swelling, effusion, warmth, and pain with movement

Common Investigations in Rheumatology

- general: CBC, electrolytes, Cr
- acute phase reactants: ESR, CRP, ferritin, albumin, fibrinogen, platelets
- complement (C3, C4)
- U/A to detect disease complications (proteinuria, active sediment)
- serology: see Table 10
- synovial fluid analysis
- radiology (plain film x-ray, CT, MRI, U/S, bone densitometry, angiography, bone scan)

Synovial Fluid Analysis

- synovial fluid is an ultrafiltrate of plasma plus hyaluronic acid; it lubricates joint surfaces and nourishes articular cartilage

Indications

- diagnostic: mandatory if septic arthritis suspected; advised if crystal arthritis or hemarthrosis suspected; advised if unexplained effusion in accessible joint
- therapeutic: drainage of blood, purulent or tense effusions; corticosteroid injection

Contraindications

- absolute: open lesion or suspected infection of overlying skin or soft tissue
- relative: bleeding diathesis, thrombocytopenia, prosthetic joint

Synovial Fluid Analysis

- ensure synovial fluid is described in terms of colour, clarity, viscosity, and quantity
- culture and gram stain (bacteria, mycobacteria, fungi)
- if only have 1 mL of fluid, prioritize culture and gram stain
- cell count and differential
- crystal examination (microscopy with polarized light)
 - gout (monosodium urate) → needle-shaped, negatively birefringent (bright yellow)
 - pseudogout (CPPD) → rhomboid-shaped, positively birefringent (pale blue)

Table 8. Synovial Fluid Analysis

Parameter	Normal	Non-Inflammatory	Inflammatory	Infectious	Hemorrhagic
Colour	Pale yellow	Pale yellow	Pale yellow	Yellow to white	Red/brown
Clarity	Clear	Clear	Opaque	Opaque	Sanguinous
Viscosity	High (due to hyaluronic acid)	High	Low	Low or paradoxically high if purulent	Variable
WBC/mm ³	<200	<2,000	>2,000	Higher cell counts (particularly >50,000) suggestive	Variable
% PMN	<25%	<25%	>25%	>75%	Variable
Culture/ Gram Stain	–	–	–	Usually positive	–
Examples		Trauma OA Neuropathy Hypertrophic – arthropathy	Seropositives Seronegatives Crystal arthropathies	<i>S. aureus</i> Gram negative GC → difficult to culture	Trauma Hemophilia

ESR

Advantages

- Much clinical information
- May reflect overall health status

Disadvantages

- Affected by age and gender
- Affected by RBC/morphology/anemia/polycythemia
- Reflects many plasma proteins
- Responds slowly to inflammatory stimulus
- Requires fresh sample

CRP

Advantages

- Unaffected by age/gender
- Rapid response to inflammatory stimulus
- Wide range of clinically relevant values
- Can be measured on stored sera
- Quantification precise/reproducible

Disadvantages

- More expensive

Most Important Tests of Synovial Fluid (3 Cs)

1. Culture and gram stain
2. Cell count and differential
3. Crystal examination (protein, LDH, glucose less helpful)

Choosing Wisely Canada Recommendations

1. Do not order ANA as a screening test in patients without specific signs or symptoms of SLE or another CTD
2. Do not order an HLA-B27 unless spondyloarthritis is suspected based on specific signs or symptoms
3. Do not repeat DEXA scans more often than every 2 years
4. Do not prescribe bisphosphonates for patients at low risk of fracture
5. Do not perform whole body bone scans (e.g. scintigraphy) for diagnostic screening for peripheral and axial arthritis in the adult population

Septic Arthritis

- for any acute monoarthritis or flare of pre-existing arthritis, one must rule out septic etiology; consider empiric antibiotic treatment until septic arthritis is excluded by history, physical exam, and synovial fluid analysis
- major bacteria are gram positive cocci (75-80%) especially *S. aureus*, and gram-negative bacilli (15-20%)
- poor prognostic factors: older age, immunocompromised, delay in treatment, previously damaged joint, joint prosthesis
- see [Infectious Diseases](#) for *Gonococcal Arthritis*, ID15 and [Orthopedics](#), OR10

Septic arthritis is a medical emergency; it leads to rapid joint destruction, and there is a 10-15% risk of mortality

Degenerative Arthritis: Osteoarthritis

Definition

- progressive deterioration of articular cartilage and surrounding joint structures caused by genetic, metabolic, biochemical, and biomechanical factors with secondary components of inflammation

Classification (based on etiology)

- primary (idiopathic)
 - most common, unknown etiology
- secondary
 - post-traumatic or mechanical
 - post-inflammatory (e.g. RA) or post-infectious
 - heritable skeletal disorders (e.g. scoliosis)
 - endocrine disorders (e.g. acromegaly, hyperparathyroidism, hypothyroidism)
 - metabolic disorders (e.g. gout, pseudogout, hemochromatosis, Wilson's disease, ochronosis)
 - neuropathic (e.g. Charcot joints)
 - atypical joint trauma due to peripheral neuropathy (e.g. DM, syphilis)
 - AVN
 - other (e.g. congenital malformation)

Pathophysiology

- the process appears to be initiated by abnormalities in biomechanical forces and/or, less often, in cartilage
- elevated production of pro-inflammatory cytokines is important in OA progression
- tissue catabolism > repair
- genetic, environmental, mechanical loading, age and gender factors contribute, but mechanism is unknown
- now considered to be a systemic musculoskeletal disorder rather than a focal disorder of synovial joints

Epidemiology

- most common arthropathy (accounts for ~75% of all arthritis)
- increased prevalence with increasing age (35% of 30 yr olds, 85% of 80 yr olds)

Risk Factors

- genetic predisposition, advanced age, obesity (for knee and hand OA), female, trauma

Signs and Symptoms

- localized to affected joints (not a systemic disease)
- pain is often insidious, gradually progressive, with intermittent flares and remissions, neuropathic pain may also be present
- fatigue, poor sleep, impact on mood (depression, anxiety)

Table 9. Signs and Symptoms of OA

Signs	Symptoms
Joint line tenderness; stress pain ± joint effusion	Joint pain with motion; relieved with rest
Bony enlargement at affected joints	Short duration of stiffness (<1/2 h) after immobility
Malalignment/deformity (angulation)	Joint instability/buckling
Limited ROM	Joint locking due to "joint mouse" (bone or cartilage fragment)
Crepitus on passive ROM	Loss of function or other internal derangements (e.g. meniscal tear)
Inflammation (mild if present)	
Periarticular muscle atrophy	

Joint Involvement

- asymmetric (knees usually affected bilaterally)
- hand
 - DIP (Heberden's nodes = osteophytes → enlargement of joints)
 - PIP (Bouchard's nodes)
 - CMC (usually thumb squaring)
 - 1st MCP (other MCPs are usually spared)
- hip
 - usually presents as groin pain ± dull or sharp pain in the trochanteric area, internal rotation and abduction are lost first
 - pain can radiate to the anterior thigh, but generally does not go below the knee
- knee
 - initial narrowing of one compartment, medial > lateral; seen on standing x-rays, often patellar-femoral joint involved

Obesity is linked to OA in the knee as well as CMC, which suggests a systemic inflammatory component to OA

- Hand (DIP, PIP, 1st CMC)
- Hip
- Knee
- 1st MTP
- L-spine (L4-L5, L5-S1)
- C-spine
- Uncommon: ankle, shoulder, elbow, MCP, rest of wrist

© Linda Colati

Figure 3. Common sites of joint involvement in OA

1. Thumb squaring
2. Heberden's nodes
3. Bouchard's nodes

© Tabby Lullham 2011

Figure 4. Hand findings in OA

OA of MCP joints can be seen in hemochromatosis or chondrocalcinosis

Hint: Bouchard's is closer to the Body

The Radiographic Hallmarks of OA

- Joint space narrowing
- Subchondral sclerosis
- Subchondral cysts
- Osteophytes

- foot
 - common in first MTP and midfoot
- lumbar spine
 - very common, especially L4-L5, L5-S1
 - degeneration of intervertebral discs and facet joints
 - reactive bone growth can contribute to neurological impingement (e.g. sciatica, neurogenic claudication) or spondylolisthesis (forward or backward movement of one vertebra over another)
- cervical spine
 - commonly presents with neck pain that radiates to scapula, especially in mid-lower cervical area (C5 and C6)

Investigations

- blood work
 - normal CBC and ESR, CRP
 - negative RF and ANA
- radiology: 4 hallmark findings
- synovial fluid: non-inflammatory (see Table 8)

Treatment

- presently no treatment alters the natural history of OA
- prevention: prevent sports injury, healthy weight management
- **non-pharmacological therapy**
 - weight loss (minimum 5-10 lb loss) if overweight
 - physiotherapy: heat/cold, low impact exercise programs
 - occupational therapy: aids, splints, cane, walker, bracing
- **pharmacological therapy** (see Table 32)
 - oral: acetaminophen/NSAIDs, glucosamine ± chondroitin (nutraceuticals not proven)
 - treat neuropathic pain if present (anti-depressants, anti-epileptics, etc.)
 - joint injections: corticosteroid, hyaluronic acid (questionable benefit)
 - topical: capsaicin, NSAIDs
- **surgical treatment**
 - joint debridement, osteotomy, total and/or partial joint replacement, fusion (see [Orthopedics](#), OR30)

Differential Diagnosis of Elevated ESR

- Systemic inflammatory diseases
- Localized inflammatory diseases
- Malignancy
- Trauma
- Infection
- Tissue injury/ischemia

ESR (and CRP) is insensitive for polymyositis/dermatomyositis, AS, scleroderma, SLE, viral infections

ESR can also be elevated in anemia, end-stage renal disease, females, increased age, obesity

Glucosamine Therapy for Treating Osteoarthritis

Cochrane DB Syst Rev 2009;CD002946

Study: Meta-analysis of 25 RCTs (n=4,963) examining the efficacy of glucosamine on OA.

Results: Collectively the 25 RCTs favored glucosamine over placebo for total reduction in pain with 22% improvement as well as improvement in function using the Lequesne index. However, results were not uniformly positive. Only the glucosamine containing Rotta preparation was found to be significant. Rotta preparation also showed that glucosamine was able to slow radiological evidence of OA over a 3 yr period. Glucosamine had an excellent safety profile.

Conclusion: Rotta preparation of glucosamine was superior to placebo in the treatment of pain and functional impairment resulting from OA.

Intraarticular Corticosteroid for Treatment of Osteoarthritis of the Knee

Cochrane DB Syst Rev 2009;CD005328

Population: Patients with osteoarthritis (OA) of the knee.

Intervention: Intraarticular (IA) corticosteroid injection.

Results: 28 RCTs and quasi-RCTs (n=1,973). IA corticosteroids were more effective than placebo for pain reduction and global assessment at 1 wk post-injection. There was significant pain reduction at 2 and 3 wk, but no benefit for pain and function beyond 4 wk post-injection. There was no benefit for global function beyond 1 wk post-injection. There were higher rates of pain reduction at 4 wk post-injection for triamcinolone hexacetonide vs. betamethasone. There was no difference between IA corticosteroids and joint lavage in outcomes or safety. Hyaluronic acid injections showed better response than IA corticosteroids between 5 and 13 wk post-injection.

Conclusion: IA corticosteroid injection is effective for the short-term treatment of OA of the knee with few side effects. Hyaluronic acid therapy can provide more lasting results.

Seropositive Rheumatic Disease

- diagnosis vs. classification in rheumatology
 - diagnostic criteria are often dependent on disease progression and evolution over time, as early objective measures are often unavailable
 - classification criteria are derived from studying patients with long-term diseases and clear diagnoses in order to determine which criteria have good specificity in the early prediction of certain diagnoses
- seropositive arthropathies are characterized by the presence of a serologic marker such as positive RF or ANA
- a small subset of the vasculitides, the small vessel ANCA-associated vasculitides, have a measurable serological component, but even these are often considered a separate entity from seropositive disease by experts

Table 10. Autoantibodies and their Prevalence in Rheumatic Diseases

Autoantibody	Disease	Healthy Controls	Comments
RF	RA 80% SS 50% SLE 20%	<5% 10-20% >65	Autoantibodies directed against Fc domain of IgG Sensitive in RA (can be negative early in disease course), levels correlate with disease activity Present in most seropositive diseases Non-specific; may be present in IE, TB, hepatitis C, silicosis, sarcoidosis
Anti-CCP	RA 80%		Specific for RA (94-98%) May be useful in early disease and to predict aggressive disease
ANA	SLE 98% MCTD 100% SS 40-70% CREST 60-80%	<5% (seen in other CTDs)	Ab against nuclear components (DNA, RNA, histones, centromere) Sensitive but not specific for SLE Given high false positive rate -only measure when high pre-test probability of CTD
Anti-dsDNA	SLE 50-70%	0%	Specific for SLE (95%) Levels correlate with disease activity
Anti-Sm	SLE <30%	0%	Specific but not sensitive for SLE Does not correlate with SLE disease activity
Anti-Ro (SSA)	SS 40-95% SSc 21% SLE 32% RA 15%	0.5%	Subacute cutaneous SLE (74%) May be only Ab present in ANA negative SLE Increases risk of having child with neonatal lupus syndrome
Anti-La (SSB)	SS 40% SLE 10%	0%	Usually occurs with anti-Ro Specific for SS and SLE when anti-Ro is also positive Increases risk of having child with neonatal lupus syndrome
Antiphospholipid Ab (LAC, ACLA)	APLA 100% SLE 31-40%	<5%	By definition present in APLA Only small subset of SLE patients develop clinical syndrome of APLA If positive, will often get a false positive VDRL test
Anti-Histone	Drug-induced SLE 95% SLE 30-80%	0% 0%	Highly specific for drug-induced SLE
Anti-RNP	MCTD		High titres present in MCTD; present in many other CTD (especially SLE)
Anti-Centromere	CREST >80%	0%	Specific for CREST variant of systemic sclerosis
Anti-Topoisomerase I (formerly Scl-70)	Diffuse SSc 26-76%	0%	Specific for SSc Increased risk pulmonary fibrosis in SSc
c-ANCA	Active GPA >90%	0%	Specific and sensitive
p-ANCA	GPA 10% Other vasculitis	0%	Nonspecific and poor sensitivity (found in ulcerative colitis, PAN, microscopic polyangiitis, Churg-Strauss, rapidly progressive glomerulonephritis)
Anti-Mi-2	DMM 15-20%		Specific but not sensitive (not available in all centres)
Ab Against RBCs, WBCs, or Platelets	SLE		Perform direct Coomb's test Test Hb, reticulocyte, leukocyte and platelet count, antiplatelet Abs

- note: some individuals in the normal population test positive for RF and/or ANA, but do not have the conditions listed in Table 10

OARSI Guidelines for the Non-Surgical Management of Knee Osteoarthritis

Osteoarthritis Cartilage 2014;22:363-388

Objective: To develop concise, updated consensus guidelines for the management of knee OA.

Methods: The OA Guidelines Development Group consisted of 13 physicians from relevant medical specialties and a patient representative. Based on previous OA guidelines and a systematic review of the OA literature, 29 treatment modalities were investigated. Treatments were recommended as Appropriate, Uncertain, or Not Appropriate, for each of four clinical sub-phenotypes and accompanied by 1-10 risk and benefit scores.

Results: Appropriate treatment modalities for all individuals with knee OA included biomechanical interventions, IA corticosteroids, exercise, self-management and education, strength training, and weight management. Treatments appropriate for specific clinical sub-phenotypes included acetaminophen, balneotherapy, capsaicin, canes, duloxetine, oral and topical NSAIDs. Treatments of uncertain appropriateness for specific clinical sub-phenotypes included acupuncture, avocado soybean unsaponifiables, chondroitin, crutches, diacerein, glucosamine, IA hyaluronic acid, opioids, rosehip, transcutaneous electrical nerve stimulation, and U/S. Treatments voted not appropriate included risperidone and neuromuscular electrical stimulation.

Conclusion: Several mainstream treatments are effective for all patients with knee OA, whereas others are only appropriate for certain subtypes. Treatments of uncertain appropriateness can still be considered as treatment and should be based on risk-benefit profile and individual characteristics, as well as comorbidities and preferences of the patient.

Connective Tissue Disorders

Table 11. Features of Seropositive Arthropathies

	RA	SLE	Scleroderma	Dermatomyositis
CLINICAL FEATURES				
History	Symmetrical polyarthritides (small joint involvement) Morning stiffness (>1 h)	Multisystemic disease: rash, photosensitivity, Raynaud's, alopecia, cardiac and pulmonary serositis, CNS symptoms, glomerulonephritis	Skin tightness, stiffness of fingers, Raynaud's, heartburn, dysphagia, pulmonary HTN, renal crisis with new onset HTN or hypertensive urgency/emergency, dyspnea on exertion	Heliotrope rash (periorbital), Gottron's papules (violaceous papules over knuckles and IP joints) ± poikiloderma Shawl sign: macular erythema over chest and shoulder Proximal muscle weakness ± pain Dyspnea on exertion
Physical Examination	Effused joints Tenosynovitis Subcutaneous nodules Joint deformities Bone-on-bone crepitus in advanced disease	Confirm historical findings (rash, serositis, renal, CVS, etc.) ± effused (typically small) joints (can be minimal, look for soft tissue swelling)	Skin tightness on dorsum of hand, facial skin tightening, telangiectasia, calcinosis, non-effused joint, inspiratory crackles	Rash, proximal muscle weakness, inspiratory crackles
LABORATORY				
Non-Specific	↑ ESR in 50-60% ↑ platelets ↓ Hb	↑ ESR ↓ platelets (autoimmune) ↓ Hb (autoimmune) ↓ WBC (leukopenia, lymphopenia)	↑ ESR ↓ Hb Normal WBC	Possible increased ESR ↓ Hb Normal WBC
Specific	RF +ve in ~80% Anti-CCP +ve in ~80%	ANA +ve in 98% Anti-dsDNA +ve in 50-70% Anti-SM +ve in 30% ↓ C3, C4, total hemolytic complement False positive VDRL (in SLE subtypes) ↑ PTT (in SLE subtypes, e.g. APLA)	ANA +ve in >90% Anti-topoisomerase 1 (diffuse) Anti-centromere (usually in CREST, see RH13)	CK elevated in 80% ANA +ve in 33% anti-Jo-1, anti-Mi-2 Muscle biopsy EMG MRI
Radiographs	Periarticular osteopenia Joint space narrowing Erosions Absence of bone repair Symmetric/concentric	Non-erosive ± osteopenia ± soft tissue swelling	± pulmonary fibrosis ± esophageal dysmotility ± calcinosis ± ILD	± esophageal dysmotility ± ILD ± calcifications

Rheumatoid Arthritis

Definition

- chronic, symmetric, erosive synovitis of peripheral joints (e.g. wrists, MCPs, MTPs)
- characterized by a number of extra-articular features

Table 12. 2010 ACR/EULAR Classification Criteria for RA

Criteria	Score	Comments
1. Joint involvement (swollen or tender)		
1 large joint (shoulders, elbows, hips, knees, and ankles)	0	
2-10 large joints	1	
1-3 small joints (MCPs, PIPs, wrists, 2nd-5th MTPs)	2	
4-10 small joints	3	
>10 joints (at least 1 small joint)	5	
2. Serology		Total score of ≥6: definite RA Must have ≥1 joint with definite clinical swelling, not better explained by other disease
Negative RF and negative Anti-CCP	0	
Low-positive RF or low-positive Anti-CCP (<3x ULN)	2	
High-positive RF or high-positive Anti-CCP (>3x ULN)	3	
3. Acute phase reactants		
Normal CRP and normal ESR	0	
Abnormal CRP and abnormal ESR	1	
4. Duration of symptoms		
<6 wk	0	
≥6 wk	1	

Arthritis Rheum 2010;62:2569-2581

RA is an independent risk factor for atherosclerosis and CV disease. RA is associated with increased overall mortality/morbidity from all causes: CV disease, neoplasm (especially lymphoma), infection

Common Presentation

- Morning stiffness >1 h, improves with use
- Symmetric joint involvement
- Initially involves small joints of hands and feet
- Constitutional symptoms

Pathophysiology

- autoimmune disorder, unknown etiology
- complex interaction of genes and environment leading to breakdown of immune tolerance: many pathways result in autoreactivity leading to a final common pathway to synovial inflammation
 - genetic predisposition: HLA-DR4/DR1 association (93% of patients have either HLA type), cytokine promoters, T cell signaling
 - epigenetic: DNA hypomethylation, dysregulated histones, microRNA expression
 - environment: repeated activation of innate immunity, cigarette smoking increases susceptibility 20-40 fold
 - ♦ induction of enzymes that convert arginine to citrulline caused by environmental stress (cigarette smoking)
 - ♦ RA: propensity for immune reactivity to neopeptides created by protein citrullination and production of anti-citrullinated protein antibodies
 - ♦ second-hit required for autoantibody-mediated synovial inflammation: increase in vascular permeability provides access to joint and permits complement fixation, recruitment of immune cells, and inflammation
- once inflammatory process is established, synovium organizes itself into an invasive tissue that degrades cartilage and bone
 - direct invasion of proliferating synovial fibroblast cells into cartilage at the pannus-cartilage junction; inflammatory mediators lead to release of collagenases resulting in destruction of articular cartilage and subchondral bone
 - fibroblast-like synoviocytes in the rheumatoid synovium can migrate from joint to joint (may explain symmetric polyarticular presentation)
- progressive bone destruction with absence of bone repair in response to inflammation
 - TNF increases osteoclasts and decreases osteoblasts at the site of inflammation
 - RANK ligand regulates osteoclast-mediated destruction

Epidemiology

- most common inflammatory arthritis: prevalence 1% of population
- F:M = 3:1
- age of onset 20-40 yr

Signs and Symptoms

- variable course of exacerbations and remissions
- morning stiffness >1 h, improves with use, increases with rest
- polyarthritis: symmetric joint involvement (tender, swollen), small joints affected, most commonly MCP, PIP, MTP
- extra-articular (systemic) symptoms: profound fatigue, depression, myalgia, weight loss
- limitation of function and decrease in global functional status
- complications of chronic synovitis
 - signs of mechanical joint damage: loss of motion, instability, deformity, crepitus, joint deformities
 - ♦ swan neck deformity, boutonniere deformity
 - ♦ ulnar deviation of MCP, radial deviation of wrist joint
 - ♦ hammer toe, mallet toe, claw toe
 - ♦ flexion contractures
 - atlanto-axial and subaxial subluxation
 - ♦ C-spine instability
 - ♦ neurological impingement (long tract signs)
 - ♦ difficult/dangerous intubation: risk of worsening subluxation and damage to spinal cord
 - limited shoulder mobility, spontaneous tears of the rotator cuff leading to chronic spasm
 - tenosynovitis → may cause rupture of tendons
 - carpal tunnel syndrome
 - ruptured Baker's cyst (outpouching of synovium behind the knee); presentation similar to acute DVT

Table 13. Extra-Articular Features of RA Classified by Underlying Pathophysiology

System	Vasculitic	Lymphocytic Infiltrate
Skin	Periungual infarction, cutaneous ulcers, palpable purpura	Rheumatoid nodules (may have vasculitic component)
Ocular	Episcleritis, scleritis	Keratoconjunctivitis sicca
Head and Neck		Xerostomia, Hashimoto's thyroiditis (see Endocrinology , E27)
Cardiac		Peri-/myocarditis, valvular disease, conduction defects
Pulmonary		Pulmonary fibrosis, pleural effusion, pleuritis, pulmonary nodules
Neurologic	Peripheral neuropathy: sensory stocking-glove, mononeuritis multiplex	
Hematologic		Splenomegaly, neutropenia (Felty's syndrome)
Renal		Amyloidosis – caused by accumulation of abnormal proteins

Figure 5. Common sites of joint involvement in RA

Figure 6. Joint deformities

Syndromes in RA

- SS (common): keratoconjunctivitis sicca and xerostomia (dry eyes and mouth)
- Caplan's syndrome (rare): multiple pulmonary nodules and pneumoconiosis
- Felty's syndrome (rare): arthritis, splenomegaly, neutropenia

Classification of Global Functional Status in RA

- **Class I:** able to perform usual ADLs (self-care, vocational, avocational)
- **Class II:** able to perform self-care and vocational activities, restriction of avocational activities
- **Class III:** able to perform self-care, restriction of vocational and avocational activities
- **Class IV:** limited ability to perform self-care, vocational, and avocational activities

Investigations

- blood work
 - RF: sensitivity 80% but non-specific; may not be present at onset of symptoms; levels correlate with disease activity
 - ♦ can be associated with more erosions, more extra-articular manifestations, and worse function
 - anti-CCP: sensitivity 80% but more specific (94-98%); may precede onset of symptoms
 - increased disease activity is associated with decreased Hb (anemia of chronic disease), increased platelets, ESR, CRP, and RF
- imaging
 - x-rays may be normal at onset
 - first change is periarticular osteopenia, followed by erosions
 - U/S, MRI may be used to image hands to detect early synovitis and erosions

Treatment

- goals of therapy: remission or lowest possible disease activity
 - control disease activity
 - relieve pain and stiffness
 - maintain function and lifestyle
 - prevent or control joint damage
 - key is early diagnosis and early intervention with DMARDs
 - “window of opportunity” = early treatment within first 3 mo of disease may allow better control/remission
- behavioural
 - exercise program (isometrics and active, gentle ROM exercise during flares, aquatic/aerobic/strengthening exercise between flares), assistive devices as needed
 - job modification may be necessary
- pharmacologic: alter disease progression
 - DMARDs
 - ♦ Standard of care and should be started as soon as possible
 - ♦ MTX is the gold standard and is first-line unless contraindicated
 - delayed onset of action (may take 8-12 wks)
 - potential toxicities: GI, hematologic, hepatic, pulmonary, teratogenic
 - if inadequate response (3-6 mo) → combine or switch
 - add-ons include: hydroxychloroquine, sulfasalazine, leflunomide
 - biologics
 - ♦ indicated if inadequate response to DMARDs
 - ♦ can be combined with DMARD therapy
 - ♦ options: infliximab, etanercept, adalimumab, abatacept, rituximab, tocilizumab
 - ♦ reassess every 3-6 mo and monitor disease severity
- pharmacologic: reduce inflammation and pain
 - NSAIDs
 - ♦ individualize according to efficacy and tolerability
 - ♦ contraindicated/cautioned in some patients (e.g. PUD, ischemic cardiac disease, pregnancy)
 - ♦ add acetaminophen ± opioid prn for synergistic pain control
 - corticosteroids
 - ♦ local: injections to control symptoms in a specific joint
 - ♦ systemic (prednisone)
 - low dose (5-10 mg/d) useful for short-term to improve symptoms if NSAIDs ineffective, to bridge gap until DMARDs take effect
 - severe RA: add low dose prednisone to DMARDs
 - do baseline DEXA bone density scan and consider bone supportive pharmacologic therapy if using corticosteroids >3 mo at 7.5mg/d
 - cautions/contraindications: active infection, TB, osteoporosis, HTN, gastric ulcer, DM

Follow-Up Management and Clinical Outcomes

- follow-up every 3-6 mo, then 6-12 mo after inflammation has been suppressed
- examine joints for active inflammation – if active, consider adjusting medications, PT/OT
- if assessment reveals joint damage – consider analgesia, referral to PT/OT, surgical options
- outcome depends on disease activity, joint damage, physical functional status, psychological health, and comorbidities

Poor prognostic features of RA include: young age of onset, high RF titer, elevated ESR, activity of >20 joints, and presence of extra-articular features

Side Effects of Steroids

- Weight gain
- Osteoporosis
- AVN
- Cataracts, glaucoma
- PUD
- Susceptibility to infection
- Easy bruising
- Acne
- HTN
- Hyperlipidemia
- Hypokalemia, hyperglycemia
- Mood swings

Only DMARDs and biologics (not analgesics or NSAIDs) alter the course of RA

Comparison of Treatment Strategies in Early Rheumatoid Arthritis

Ann Intern Med 2007;146:406-415

Study: RCT of 508 patients comparing 4 different treatment strategies for early RA (known as the BEST trial).

Intervention

- Group 1: Sequential Monotherapy with traditional DMARDs
- Group 2: Step-Up Combination Therapy
- Group 3: Initial Combination Therapy with prednisone (high dose)
- Group 4: Initial Combination Therapy with infliximab

Results: Patients in groups 3 and 4 responded faster and had significantly greater overall change in physical function scores after the first year of treatment. By end of the second year, groups 1 and 2 had achieved a similar response to groups 3 and 4. Groups 3 and 4 also showed significantly less radiologic progression of their disease over two years than groups 1 and 2. There were no significant differences in toxicity levels between the 4 groups.

Conclusions: Initial combination therapy with prednisone or infliximab results in faster response rates. Whether faster initial response rates leads to better long-term disease outcomes has not yet been studied.

- functional capacity is a useful tool for determining therapeutic effectiveness: many tools for evaluation have been validated
- patients with RA have an increased prevalence of other serious illnesses: infection (e.g. pulmonary, skin, joint), renal impairment, lymphoproliferative disorders, cardiovascular disease (correlates with disease activity and duration)
- increased risk of premature mortality, decreased life expectancy (most mortality not directly caused by RA)

Surgical Therapy

- indicated for structural joint damage
- surgical options include: synovectomy, joint replacement, joint fusion, reconstruction/tendon repair

Systemic Lupus Erythematosus

- see [Nephrology](#), NP22 and [Dermatology](#), D41

Definition

- chronic inflammatory multi-system disease of unknown etiology
- characterized by production of autoantibodies and diverse clinical manifestations

Table 14. Diagnostic Criteria of SLE*

Criteria	Description
CLINICAL	
Malar rash	Classic "butterfly rash", sparing of nasolabial folds, no scarring
Discoid rash	May cause scarring due to invasion of basement membrane
Photosensitivity	Skin rash in reaction to sunlight
Oral/nasal ulcers	Usually painless
Arthritis	Symmetric, involving ≥ 2 small or large peripheral joints, non-erosive
Serositis	Pleuritis or pericarditis
Neurologic disorder	Seizures or psychosis
LABORATORY	
Renal disorder	Proteinuria (>0.5 g/d or 3+) Cellular casts (RBC, Hb, granular, tubular, mixed)
Hematologic disorder	Hemolytic anemia, leukopenia, lymphopenia, thrombocytopenia
Immunologic disorder	Anti-dsDNA or anti-Sm or antiphospholipid Ab (anticardiolipin Ab, SLE anticoagulant) or false positive VDRL with 6 mo confirmatory negative
ANA	Most sensitive test (98%), not specific

*Note: "4, 7, 11" rule \rightarrow 4 (or more) out of 11 criteria (4 lab, 7 clinical) must be present, serially or simultaneously, for diagnosis
American College of Rheumatology, 1997 update

Etiology and Pathophysiology

- production of autoantibodies causing multi-organ inflammation
- multi-factorial etiology
- genetics
 - common association with HLA-B8/DR3; $\sim 10\%$ have positive family history
 - strong association with defects in apoptotic clearance \rightarrow fragments of nuclear particles captured by antigen-presenting cells \rightarrow develop anti-nuclear antibodies
 - cytokines involved in inflammatory process and tissue injury: B-lymphocyte stimulator (BlyS), IL-6, IL-17, IL-18, TNF- α
- environment
 - UV radiation, cigarette smoking, infection, vitamin D deficiency
- estrogen
 - increased incidence after puberty, decreased incidence after menopause
 - men with SLE have higher concentration of estrogenic metabolites
- infection
 - viral (non-specific stimulant of immune response)
- drug-induced
 - anti-hypertensives (hydralazine), anti-convulsants (phenytoin), anti-arrhythmics (procainamide), isoniazid, biologics, oral contraceptive pills
 - anti-histone Ab are commonly seen in drug-induced SLE
 - symptoms resolve with discontinuation of offending drug

CRA Guidelines for Pharmacological Management of RA with Traditional and Biologic DMARDs
J Rheumatol 2011;39:1559-1582

CRA Recommendations of RA Pharmacologic Management

- General Management: Remission is the goal of management and if not possible, minimal disease activity and quality of life improvement are desired. Poor prognostic factors should be assessed at baseline (RF, functional limitation, extra-articular features). Active RA patients should be monitored every 1-3 mo. A change in management should be considered where erosions are seen on x-ray despite clinical response.
- Glucocorticoids: Should be used at the lowest possible dose and tapered as soon as possible. Can be added to initial DMARD therapy or used for managing flares, or symptom control if all other options have been exhausted.
- Treatment with MTX or DMARD: MTX is the preferred DMARD and should be used unless contraindicated. DMARDs should be used rapidly in patients with persistent synovitis. CBC, LFT, renal function, and CXR should be assessed prior to MTX therapy. MTX requires individualized dosing. In patients with poor prognostic features or high disease activity, DMARD combinations where MTX is the anchor medication should be considered.

Biologics are indicated for therapy in patients who continue to have moderate-high disease activity despite being treated with at least two DMARDs in therapeutic doses for 3 mo. Anti-TNFs are the first line recommended treatment after DMARDs. Addition of MTX to biologics improves efficacy.

Diagnostic Criteria of SLE

MD SOAP BRAIN

Malar rash	Blood
Discoid rash	Renal
Serositis	Arthritis
Oral ulcers	Immune
ANA	Neurologic
Photosensitivity	

Figure 7. Multi-factorial etiology of SLE

Epidemiology

- prevalence: 0.05% overall
- F:M = 10:1
- age of onset in reproductive yr (13-40)
- more common and severe in African-Americans and Asians
- bimodal mortality pattern
 - early (within 2 yr)
 - ♦ active SLE, active nephritis, infection secondary to steroid use
 - late (>10 yr)
 - ♦ inactive SLE, inactive nephritis, atherosclerosis likely due to chronic inflammation

Radiographically, the arthritis of SLE is non-erosive (unlike RA)

Consider SLE in a patient who has involvement of 2 or more organ systems

Signs and Symptoms

- characterized by periods of exacerbation and remission

Table 15. Symptoms of SLE

System	Symptoms
Systemic	Fatigue, malaise, weight loss, fever, lymphadenopathy
Renal	HTN, peripheral edema, glomerulonephritis, renal failure
Dermatologic	Photosensitivity, malar rash, discoid rash, oral ulcers, alopecia (hair loss), purpura, panniculitis (inflammation of subcutaneous fat and muscle tissue), urticaria
Musculoskeletal	Polyarthralgias, polyarthritis, myalgias, AVN; reducible deformities of hand = Jaccoud's arthritis
Ophthalmic	Keratoconjunctivitis sicca, episcleritis, scleritis, cytooid bodies (cotton wool exudates on fundoscopy = infarction of nerve cell layer of retina)
Cardiac	Pericarditis, CAD, non-bacterial endocarditis (Libman-Sachs), myocarditis Note: SLE is an independent risk factor for atherosclerosis and CAD
Vascular	Raynaud's phenomenon, livedo reticularis (mottled discolouration of skin due to narrowing of blood vessels, characteristic lacy or net-like appearance), thrombosis, vasculitis
Respiratory	Pleuritis, ILD, pulmonary HTN, PE, alveolar hemorrhage
Gastrointestinal	Pancreatitis, SLE enteropathy, hepatitis, hepatomegaly, splenomegaly
Neurologic	H/A, depression, psychosis, seizures, cerebritis, transverse myelitis, peripheral neuropathy, stroke
Life/Organ-Threatening	Cardiac: coronary vasculitis, malignant HTN, tamponade Hematologic: hemolytic anemia, neutropenia, thrombocytopenia, TTP, thrombosis Neurologic: seizures, CVA, stroke Respiratory: pulmonary hypertension, pulmonary hemorrhage, emboli

Drug-Induced SLE

Often presents atypically with systemic features and serositis; usually associated with anti-histone Ab

Investigations

- ANA (sensitivity 98%, but poor specificity → used as a screening test, ANA titres are not useful to follow disease course)
- anti-dsDNA and anti-Sm are specific (95-99%)
- anti-dsDNA titer and serum complement (C3, C4) are useful to monitor treatment response in patients who are clinically and serologically concordant
 - anti-dsDNA increases and C3 and C4 decrease with disease activity
- antiphospholipid Ab (anti-cardiolipin Ab and SLE anticoagulant), may cause increased risk of clotting and increased aPTT

Raynaud's Phenomenon

Vasospastic disorder characteristically causing discolouration of fingers and toes (white → blue → red).
Classic triggers: cold and emotional stress

Treatment

- **goals of therapy**
 - treat early and avoid long-term steroid use, if unavoidable see [Endocrinology](#), E42 for osteoporosis management
 - if high doses of steroids necessary for long-term control, add steroid-sparing agents and taper when possible
 - treatment is tailored to organ system involved and severity of disease
 - all medications used to treat SLE require periodic monitoring for potential toxicity
- **dermatologic**
 - sunscreen, avoid UV light and estrogens
 - topical steroids, hydroxychloroquine
- **musculoskeletal**
 - NSAIDs ± gastroprotective agent for arthritis (also beneficial for pleuritis and pericarditis)
 - hydroxychloroquine improves long-term control and prevents flares
 - bisphosphonates, calcium, vitamin D to combat osteoporosis
- **organ-threatening disease**
 - high-dose oral prednisone or IV methylprednisolone in severe disease
 - steroid-sparing agents: azathioprine, MTX, mycophenolate mofetil
 - IV cyclophosphamide for serious organ involvement (e.g. cerebritis or lupus nephritis) see [Nephrology](#), NP22 for clinical features of lupus nephritis

Antiphospholipid Antibody Syndrome

Definition

- multi-system vasculopathy manifested by recurrent thromboembolic events, spontaneous abortions, and thrombocytopenia
- often presents with migraine-type H/As
- circulating antiphospholipid autoantibodies interfere with coagulation cascade
- **primary APLA**: occurs in the absence of other disease
- **secondary APLA**: occurs in the setting of a connective tissue disease (including SLE), malignancy, drugs (hydralazine, procainamide, phenytoin, interferon, quinidine), and infections (HIV, TB, hepatitis C, infectious mononucleosis)
- **catastrophic APLA**: development within 1 wk of small vessel thrombotic occlusion in ≥ 3 organ systems with positive antiphospholipid Ab (high mortality)

Table 16. Classification Criteria of APLA*

Criteria	Description
CLINICAL	
Vascular thrombosis	Arterial: stroke/TIA, multi-infarct dementia, MI, valvular incompetence, limb ischemia Venous: DVT, PE, renal and retinal vein thrombosis Must be confirmed by imaging or histopathology
Pregnancy morbidity	Fetal death (> 10 wk GA), recurrent spontaneous abortions (< 10 wk GA) or premature birth (< 34 wk GA)
LABORATORY	
Labs must be positive on 2 occasions, at least 12 wk apart	
SLE anticoagulant	
Anti-cardiolipin Ab	IgG and/or IgM
Anti- β_2 glycoprotein-I Ab	IgG and/or IgM

* 1 clinical and 1 laboratory criteria must be present
J Thromb Haemost 2006;4:295-306

Manifestations of APLA

- Thromboembolic events
- Spontaneous abortions
- Thrombocytopenia
- Associated with livedo reticularis, migraine headaches

Signs and Symptoms

- see clinical criteria in Table 16
- hematologic
 - thrombocytopenia, hemolytic anemia, neutropenia
- dermatologic
 - livedo reticularis, Raynaud's phenomenon, purpura, leg ulcers, and gangrene

Arterial and venous thrombosis are usually mutually exclusive

Treatment

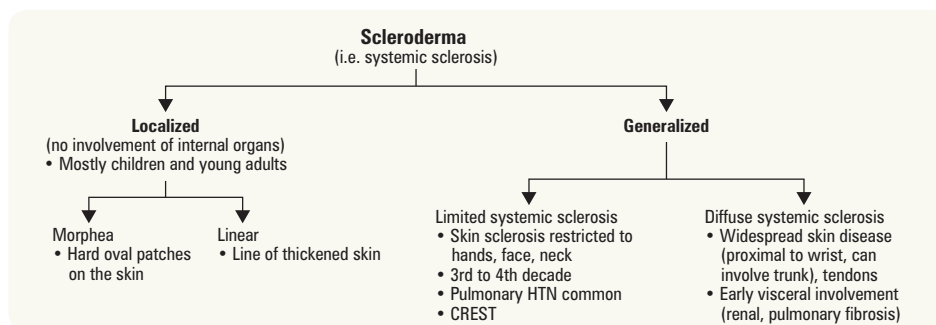

- thrombosis
 - lifelong anti-coagulation with warfarin
 - target INR 2.0-3.0 for first venous event, > 3.0 for recurrent and/or arterial event
- recurrent fetal loss
 - heparin/low molecular weight heparin \pm ASA during pregnancy
- catastrophic APLA
 - high-dose steroids, anti-coagulation, cyclophosphamide, plasmapheresis

Scleroderma (i.e. Systemic Sclerosis)

Definition

- a non-inflammatory autoimmune disorder characterized by widespread small vessel vasculopathy, production of autoantibodies, and fibroblast dysfunction causing fibrosis

CREST Syndrome

- Calcinosis
- Raynaud's phenomenon
- Esophageal dysmotility
- Sclerodactyly
- Telangiectasia

Figure 8. Forms of scleroderma

Table 17. The American College of Rheumatology (ACR)/European League Against Rheumatism (EULAR) Criteria for Scleroderma*

Item	Sub-item	Score
1. Skin thickening of fingers of both hands extending proximal to the MTPs (sufficient criterion)		9
2. Skin thickening of the fingers	Puffy fingers	2
	Sclerodactyly	4
3. Fingertip lesions	Digital tip ulcers	2
	Fingertip pitting scars	3
4. Telangiectasia		2
5. Abnormal nailfold capillaries		2
6. Pulmonary arterial HTN ± ILD (max score 2)	Pulmonary arterial HTN	2
	ILD	2
7. Raynaud's phenomenon		3
8. Scleroderma related Ab	Anticentromere	3
	Anti-topoisomerase I	
	Anti-RNA polymerase III	

* Score of ≥9 is sufficient to classify a patient as having definite scleroderma (sensitivity 0.95, specificity 0.93)
Arthritis & Rheum 2013;65(11):2737-2747

Etiology and Pathophysiology

- idiopathic vasculopathy (not vasculitis) leading to atrophy and fibrosis of tissues
 - intimal proliferation and media mucinous degeneration → progressive obliteration of vessel lumen → fibrotic tissue
 - resembles malignant HTN

Epidemiology

- F:M = 3-4:1, peaking in 5th and 6th decades
- associated with HLA-DR1
- associated with environmental exposure (silica, epoxy resins, toxic oil, aromatic hydrocarbons, polyvinyl chloride)
- limited systemic sclerosis has a higher survival prognosis (>70% at 10 yr) than diffuse systemic sclerosis (40-60% at 10 yr)

Signs and Symptoms

Table 18. Clinical Manifestations of Scleroderma

System	Features
Dermatologic	Painless non-pitting edema → skin tightening Ulcerations, calcinosis, periungual erythema, hypo/hyperpigmentation, pruritus, telangiectasias Characteristic face: mask-like facies with tight lips, beak nose, radial perioral furrows
Vascular	Raynaud's phenomenon → digital pits, gangrene
Gastrointestinal (~90%)	Distal esophageal hypomotility → dysphagia Loss of lower esophageal sphincter function → GERD, ulcerations, strictures Small bowel hypomotility → bacterial overgrowth, diarrhea, bloating, cramps, malabsorption, weight loss Large bowel hypomotility → wide mouth diverticuli are pathognomonic radiographic finding on barium study
Renal	Mild proteinuria, Cr elevation, HTN "Scleroderma renal crisis" (10-15%) may lead to malignant arterial HTN, oliguria, and microangiopathic hemolytic anemia
Pulmonary	Interstitial fibrosis, pulmonary HTN, pleurisy, pleural effusions
Cardiac	Left ventricular dysfunction, pericarditis, pericardial effusion, arrhythmias
Musculoskeletal	Polyarthralgias "Resorption of distal tufts" (radiological finding) Proximal weakness 2° to disuse, atrophy, low grade myopathy
Endocrine	Hypothyroidism

Investigations

- blood work
 - CBC, Cr, ANA
 - anti-topoisomerase 1/anti-Scl-70: specific but not sensitive for diffuse systemic sclerosis
 - anti-centromere: favours diagnosis of CREST (limited systemic sclerosis)
- PFT
 - assess for interstitial lung disease
- imaging
 - CXR for fibrosis, echo for pulmonary HTN

Scleroderma is the most common cause of secondary Raynaud's phenomenon

Lung disease is the most common cause of morbidity and mortality

Raynaud's Phenomenon DDx

COLD HAND
 Cryoglobulins/Cryofibrinogens
 Obstruction/Occupational
 Lupus erythematosus, other connective tissue disease
 Diabetes mellitus/Drugs
 Hematologic problems (polycythemia, leukemia, etc.)
 Arterial problems (atherosclerosis)/
 Anorexia nervosa
 Neurologic problems (vascular tone)
 Disease of unknown origin (idiopathic)

Features of Pathologic Raynaud's Syndrome

- New onset
- Asymmetric
- Precipitated by stimuli other than cold or emotion
- Associated with distal pulp pitting or tissue reabsorption
- Digit ischemia
- Capillary dilatation by capillaroscopy

Treatment

- dermatologic
 - good skin hygiene
 - low-dose prednisone (>20 mg may provoke renal crisis if susceptible), MTX (limited evidence)
- vascular
 - patient education on cold avoidance
 - vasodilators (CCBs, local nitroglycerine cream, systemic PGE₂ inhibitors, PDE5 inhibitors)
- gastrointestinal
 - GERD: PPIs are first line, then H₂-receptor agonists
 - small bowel bacterial overgrowth: broad spectrum antibiotics (tetracycline, metronidazole)
- renal disease
 - ACEI for hypertensive crisis
 - see [Nephrology](#), NP31 for scleroderma renal crisis
- pulmonary
 - early interstitial disease: cyclophosphamide
 - pulmonary HTN: vasodilators e.g. bosentan (Tracleer*), epoprostenol (Flolan*), PDE5 inhibitors
- cardiac
 - pericarditis: systemic steroids
- musculoskeletal
 - arthritis: NSAIDs
 - myositis: systemic steroids

Idiopathic Inflammatory Myopathy

Definition

- autoimmune diseases characterized by proximal muscle weakness ± pain
- muscle becomes damaged by a non-suppurative lymphocytic inflammatory process

Classification

- PM/DMM
- adult and juvenile form
- associated with malignancy
 - increased risk of malignancy: age >50, DMM>PM, normal CK, refractory disease
 - 2.4-6.5 fold increased risk of underlying malignancy usually in internal organs
- associated with other connective tissue disease, Raynaud's phenomenon, autoimmune disorders

Inclusion Body Myositis

- age >50, M>F, slowly progressive, vacuoles in cells on biopsy
- suspect when patient unresponsive to treatment
- distal as well as proximal muscle weakness
- muscle biopsy positive for inclusion bodies

POLYMYOSITIS/DERMATOMYOSITIS

Table 19. Classification Criteria for PM/DMM*

Criteria	Description
1. Symmetric proximal muscle weakness	Typical involvement of shoulder girdle and hip girdle
2. Elevated muscle enzymes	↑ CK, aldolase, LDH, AST, ALT
3. EMG changes	Short polyphasic motor units, high frequency repetitive discharge, insertional irritability
4. Muscle biopsy	Segmental fibre necrosis, basophilic regeneration, perivascular inflammation (DMM), endomysial inflammation (PM) and atrophy
5. Typical rash of dermatomyositis	Required for diagnosis of DMM (see below)

*Definite if 4 present, probable if 3 present NEJM 1975;292:403-407

Malignancies Associated with DMM

- Breast
- Lung
- Colon
- Ovarian

Etiology and Pathophysiology

- PM is CD8 cell-mediated muscle necrosis, found in adults
- DMM is B-cell and CD4 immune complex-mediated peri-fascicular vascular abnormalities

Signs and Symptoms

- progressive symmetrical proximal muscle weakness (shoulder and hip) developing over weeks to months
 - difficulty lifting head off pillow, arising from chair, climbing stairs
- dermatological
 - DMM has characteristic dermatological features (F>M, children and adults)
 - ♦ Gottron's papules
 - pink-violaceous, flat-topped papules overlying the dorsal surface of the interphalangeal joints

Signs of DMM

Gottron's papules and Gottron's sign are pathognomonic of DMM (occur in 70% of patients)

- ♦ Gottron's sign
 - erythematous, smooth or scaly patches over the dorsal IPs, MCPs, elbows, knees, or medial malleoli
- ♦ heliotrope rash: violaceous rash over the eyelids; usually with edema
- ♦ shawl sign: poikilodermatous erythematous rash over neck, upper chest, and shoulders
- ♦ mechanic's hands: dark, dry, thick scale on palmar and lateral surface of digits
- ♦ periungual erythema
- cardiac
 - arrhythmias, CHF, conduction defect, ventricular hypertrophy, pericarditis
- gastrointestinal
 - oropharyngeal and lower esophageal dysphagia, reflux
- pulmonary
 - weakness of respiratory muscles, ILD, aspiration pneumonia

Investigations

- blood work: CK, ANA, anti-Jo-1 (DMM), anti-Mi-2, anti-SRP
- imaging: MRI may be used to localize biopsy site
- EMG, muscle biopsy

Treatment

- non-pharmacological treatment
 - physical therapy and occupational therapy
- pharmacological treatment
 - high-dose corticosteroid (1-2 mg/kg/d) and slow taper
 - add immunosuppressive agents (azathioprine, MTX, cyclosporine)
 - IVIg if severe or refractory
 - hydroxychloroquine for DMM rash
- malignancy surveillance
 - detailed history and physical (breast, pelvic, and rectal exam)
 - CXR, abdominal and pelvic U/S, fecal occult blood, Pap test, mammogram ± CT scan (thoracic, abdominal, pelvic)

Sjögren's Syndrome

Definition

- autoimmune condition characterized by dry eyes (keratoconjunctivitis sicca/xerophthalmia) and dry mouth (xerostomia), caused by lymphocytic infiltration of salivary and lacrimal glands
- may evolve into systemic disorder with diminished exocrine gland activity in respiratory tract and skin
- primary and secondary form (associated with RA, SLE, DMM, and HIV)
- incidence estimated at 4/100,000 people
- 90% of cases are among females
- mean age of diagnosis is 40-60 yr

Patients with Sjögren's syndrome are at higher risk of non-Hodgkin's lymphoma

Table 20. American College of Rheumatology Classification for Sjögren's*

Criteria	Comments
1. Positive serum anti-SSA/Ro and/or anti-SSB/La or positive RF and ANA titer > 1:320	
2. Labial salivary gland biopsy with focal lymphocytic sialadenitis with focus score ≥ 1 focus 4/mm ²	Focus scores are histopathologic grading systems Strongly associated with phenotypic ocular and serological component's of Sjögren's
3. Keratoconjunctivitis sicca with ocular staining score > 3	Ocular staining score based on fluorescein dye examination of conjunctiva and cornea to determine clinical changes

*Classification criteria is met in patients with signs/symptoms of Sjögren's, who have at least 2 of the above features

1. *Arthritis Care & Research* 2012;64(4):475-487; 2. *Arthritis Rheum* 2011;63(7):2021-2030; 3. *Am J Ophthalmol* 2010;149(3):405-441

Signs and Symptoms

- "sicca complex": dry eyes (keratoconjunctivitis sicca/xerophthalmia), dry mouth (xerostomia)
- staphylococcal blepharitis
- dental caries, oral candidiasis, angular cheilitis (inflammation and fissuring at the labial commissures of the mouth)
- systemic complications
 - sinusitis
 - autoimmune thyroid dysfunction
 - arthralgias, arthritis
 - subclinical diffuse ILD, xerotrachea leading to chronic dry cough
 - renal disease, glomerulonephritis
 - palpable purpura, vasculitis
 - peripheral neuropathy
 - lymphoma risk greatly increased

Treatment

- ocular
 - artificial tears or surgical punctal occlusion for dry eyes

Classic Triad (identifies 93% of Sjögren's patients)

- Dry eyes
- Dry mouth (xerostomia) → dysphagia
- Arthritis (small joint, asymmetrical, non-erosive) but may be associated with rheumatoid arthritis, in which case, the arthritis is erosive and symmetric

- oral
 - good dental hygiene, hydration
 - parasympathomimetic agents that stimulate salivary flow (e.g. pilocarpine)
 - topical nystatin or clotrimazole x 4-6 wk for oral candidiasis
- systemic
 - e.g. hydroxychloroquine, corticosteroids

Mixed Connective Tissue Disease

- syndrome with features of 3 different connective tissue diseases (e.g. SLE, scleroderma, PM)
- common symptoms: Raynaud's phenomenon, swollen fingers
- blood work: anti-RNP (see Table 10)
- treatment is generally guided by the severity of symptoms and organ system involvement
- prognosis
 - 50-60% will evolve into SLE
 - 40% will evolve into scleroderma
 - only 10% will remain as MCTD for the rest of their lives
 - cardiac involvement (arrhythmia) common, renal or lung involvement rare

Overlap Syndrome

- syndrome with sufficient diagnostic features of 2+ different connective tissue diseases

Vasculitides

- inflammation and subsequent necrosis of blood vessels leading to tissue ischemia or infarction
- any organ system can be involved
- keys to diagnosis
 - clinical suspicion: suspect in cases of unexplained multiple organ ischemia or systemic illness with no evidence of malignancy or infection
 - labs non-specific: anemia, increased WBC and ESR, abnormal U/A
 - biopsy if tissue accessible
 - angiography if tissue inaccessible
- treatment generally involves corticosteroids and/or immunosuppressive agents

Table 21. Classification of Vasculitis and Characteristic Features

Classification	Characteristic Features
SMALL VESSEL	
<ul style="list-style-type: none"> • Non-ANCA-associated 	Immune complex-mediated (most common mechanism)
Predominantly cutaneous vasculitis	Also known as hypersensitivity/leukocytoclastic vasculitis
Henoch-Schönlein purpura (see Pediatrics , P94)	Vascular deposition of IgA causing systemic vasculitis (skin, GI, renal), usually self-limiting; most common in childhood
Essential cryoglobulinemic vasculitis	Systemic vasculitis caused by circulating cryoproteins forming immune complexes; may be associated with underlying infection (e.g. hepatitis C) or connective tissue disease
<ul style="list-style-type: none"> • ANCA-associated 	
Granulomatosis with polyangiitis (GPA, formerly Wegener's)	Granulomatous inflammation of vessels of respiratory tract and kidneys, initially have URTI symptoms; most common in middle age
pR3 (c-ANCA) > MPO (p-ANCA)	
Eosinophilic granulomatosis with polyangiitis (Churg-Strauss syndrome) (50% ANCA positive)	Granulomatous inflammation of vessels with hypereosinophilia and eosinophilic tissue infiltration, frequent lung involvement (asthma, allergic rhinitis), can be associated with MPO or pR3, other manifestations include coronary arteritis, myocarditis and neuropathy, average age 40s
Microangiopathic polyangiitis (70% ANCA positive, usually MPO)	Pauci-immune necrotizing vasculitis, affecting kidneys (necrotizing glomerulonephritis), lungs (capillaritis and alveolar hemorrhage), skin, most common in middle age
MEDIUM VESSEL	
Polyarteritis nodosa	Segmental, non-granulomatous necrotizing inflammation Unknown etiology in most cases, any age (average 40-50s), M>F
Kawasaki disease (see Pediatrics , P94)	Arteritis and mucocutaneous lymph node syndrome

Features of Small Vessel Vasculitis

- Palpable purpura
- Vesicles
- Chronic urticaria
- Superficial ulcers

c-ANCA: circulating anti-neutrophil cytoplasmic Ab associated with anti-pR3

p-ANCA: perinuclear anti-neutrophil cytoplasmic Ab associated with multiple antigens, e.g. lactoferrin (IBD), myeloperoxidase (microscopic polyangiitis)

Features of Medium Vessel Vasculitis

- Livedo reticularis
- Erythema nodosum
- Raynaud's phenomenon
- Nodules
- Digital infarcts
- Ulcers

Table 21. Classification of Vasculitis and Characteristic Features (continued)

Classification	Characteristic Features
LARGE VESSEL	
GCA/Temporal arteritis	Inflammation predominantly of the aorta and its branches >50 yr of age, F>M
Takayasu's arteritis	"Pulseless disease", unequal peripheral pulses, chronic inflammation, most often the aorta and its branches Usually young adults of Asian descent, F>M; risk of aortic aneurysm
OTHER VASCULITIDES	
Buerger's disease ("Thromboangiitis Obliterans")	Inflammation secondary to pathological clotting, affects small and medium-sized vessels of distal extremities, may lead to distal claudication and gangrene, most important etiologic factor is cigarette smoking Most common in young Asian males
Behçet's disease	Leukocytoclastic vasculitis, multi-system disorder presenting with ocular involvement (uveitis), recurrent oral and genital ulceration, venous thrombosis, skin and joint involvement, more common in Mediterranean and Asia, average age 30 yr old, M>F
Vasculitis mimicry (i.e. pseudovasculitis)	Cholesterol emboli, atrial myxoma

Churg-Strauss Triad

- Allergic rhinitis and asthma (often quiescent at time of vasculitis)
- Eosinophilic infiltrative disease resembling pneumonia
- Systemic vasculitis often mononeuritis multiplex/peripheral neuropathy and peripheral eosinophilia

Figure 9. Classification of vasculitides by vessel size

Small Vessel Non-ANCA Associated Vasculitis

CUTANEOUS VASCULITIS

- subdivided into
 - drug-induced vasculitis
 - serum sickness reaction
 - vasculitis associated with other underlying primary diseases

Etiology and Pathophysiology

- cutaneous vasculitis following
 - drug exposure (allopurinol, gold, sulfonamides, penicillin, phenytoin)
 - viral or bacterial infection
 - idiopathic causes
- small vessels involved (post-capillary venules most frequently)
- usually causes a leukocytoclastic vasculitis: debris from neutrophils around vessels
- sometimes due to cryoglobulins which precipitate in cold temperatures

Signs and Symptoms

- palpable purpura ± vesicles and ulceration, urticaria, macules, papules, bullae, subcutaneous nodules
 - renal or joint involvement may occur, especially in children

Investigations

- vascular involvement (both arteriole and venule) established by skin biopsy

Treatment

- stop possible offending drug
- corticosteroids ± immunosuppressive agents
- usually self-limiting

Small Vessel ANCA-Associated Vasculitis

GRANULOMATOSIS WITH POLYANGIITIS

(GPA, formerly known as Wegener's Granulomatosis)

Definition

- granulomatous inflammation of vessels that may affect the upper airways (rhinitis, sinusitis), lungs (pulmonary nodules, infiltrates), and kidneys (glomerulonephritis, renal failure)
- highly associated with c-ANCA
- incidence 5 per 100,000; more common in Northern latitudes

Table 22. Classification Criteria for GPA*

Criteria	Description
1. Nasal or oral involvement	Inflammation, ulcers, epistaxis
2. Abnormal findings on CXR	Nodules, cavitations, etc.
3. Urinary sediment	Microscopic hematuria \pm RBC casts
4. Biopsy of involved tissue	Lungs show granulomas, kidneys show necrotizing segmental glomerulonephritis

*Diagnosed if 2 or more of the above 4 criteria present

American College of Rheumatology, 1990

Classic Features of GPA

- Necrotizing granulomatous vasculitis of lower and upper respiratory tract
- Focal segmental glomerulonephritis

Etiology

- pathogenesis depends on genetic susceptibility and environmental triggers (e.g. infection)
 - dysregulated immune response due to loss of B and T-cell tolerance
 - acute vascular injury mediated by neutrophils and monocytes

Signs and Symptoms

- systemic
 - malaise, fever, weakness, weight loss
- HEENT
 - sinusitis or rhinitis, nasal crusting and bloody nasal discharge, nasoseptal perforation, saddle nose deformity
 - proptosis due to: inflammation/vasculitis involving extra-ocular muscles, granulomatous retrobulbar space occupying lesions or direct extension of masses from the upper respiratory tract
 - hearing loss due to involvement of CN VIII
- pulmonary
 - cough, hemoptysis, granulomatous upper respiratory tract masses
- renal
 - hematuria
- other
 - joint, skin, eye complaints, vasculitic neuropathy

Investigations

- blood work: anemia (normal MCV), increased WBC, increased Cr, increased ESR, elevated platelet count, ANCA (PR3 > MPO)
- urinalysis: proteinuria, hematuria, RBC casts
- CXR: pneumonitis, lung nodules, infiltrations, cavitory lesions
- biopsy: renal (segmental necrotizing glomerulonephritis), lung (granulomas, tracheobronchial erosion)
- c-ANCA and ESR often correlate with disease activity and used to monitor response to treatment in some patients

Treatment

- prednisone 1 mg/kg/d PO \pm cyclophosphamide 2 mg/kg/d PO for 3-6 mo followed by high dose MTX (20-25 mg PO/SC weekly) or azathioprine (2 mg/kg/d PO OD)
- consider biologic agents (rituximab, IVIg) and plasmapheresis (PEXIVAS trial)

RAVE Trial

NEJM 2010;363:221-232

Rituximab equivalent or superior to cyclophosphamide in severe or relapsing disease

Medium Vessel Vasculitis

POLYARTERITIS NODOSA

Definition

- systemic, necrotizing vasculitis of medium sized vessels
- ANCA negative
- 30% associated with hepatitis B positivity
- incidence 0.7 per 100,000; affects individuals between 40-60 yr; M:F = 2:1

There is an association between hepatitis B surface antigen (HBsAg) positivity and PAN

Table 23. Classification Criteria for PAN*

Criteria	Description
1. Weight loss	>4 kg, not due to dieting or other factors
2. Myalgias, weakness, or leg tenderness	Diffuse myalgias or weakness
3. Livedo reticularis	Mottled, reticular pattern over skin
4. Neuropathy	Mononeuropathy, mononeuropathy multiplex, or polyneuropathy
5. Testicular pain or tenderness	Not due to infection, trauma, or other causes
6. dBP >90 mmHg	Development of HTN with dBP >90 mmHg
7. Elevated Cr or BUN	Cr >130 µmol/L (1.5 mg/dL), BUN >14.3 mmol/L (40 mg/dL)
8. Hepatitis B positive	Presence of hepatitis B surface antigen or Ab
9. Arteriographic abnormality	Commonly aneurysms
10. Biopsy of artery	Presence of granulocytes and/or mononuclear leukocytes in the artery wall

*Diagnosed if 3 or more of the above 10 criteria present

American College of Rheumatology, 1990

Consider PAN in a non-diabetic patient with mononeuritis multiplex

Etiology and Pathophysiology

- focal panmural necrotizing inflammatory lesions in small and medium-sized arteries
- thrombosis, aneurysm, or dilatation at lesion site may occur
- healed lesions show proliferation of fibrous tissue and endothelial cells that may lead to luminal occlusion

Investigations

- blood work: CBC, ESR, Cr, BUN, p-ANCA, hepatitis B serology
- imaging: angiography
- arterial biopsy

Treatment

- prednisone 1 mg/kg/d PO and cyclophosphamide 2 mg/kg/d PO
- ± anti-viral therapy to enhance clearance of hepatitis B virus

Large Vessel Vasculitis

- see [Ophthalmology](#), OP38

GCA/TEMPORAL ARTERITIS

Table 24. Classification Criteria for GCA*

Criteria	Description
1. Age at onset ≥50	
2. New H/A	Often temporal
3. Temporal artery abnormality	Temporal artery tenderness or decreased pulsations, not due to arteriosclerosis
4. Elevated ESR	ESR ≥50 mm/h
5. Abnormal artery biopsy	Mononuclear cell infiltration or granulomatous inflammation, usually with multinucleated giant cells

*Diagnosed if 3 or more of the above 5 criteria present

American College of Rheumatology, 1990

GCA Criteria
Presence of 3 or more criteria yields sensitivity of 94%, specificity of 91%

Epidemiology

- most frequent vasculitis in North America
- patients >50 yr
- F:M = 2:1
- North-South gradient (predominance in Northern Europe/US)
- affects extracranial arteries

Signs and Symptoms

- new onset temporal H/A ± scalp tenderness due to inflammation of involved portion of the temporal or occipital arteries
- sudden, painless loss of vision and/or diplopia due to narrowing of the ophthalmic or posterior ciliary arteries (PCA more common); can affect both eyes
- tongue and jaw claudication (pain in muscles of mastication on prolonged chewing)
- PMR (proximal myalgia, constitutional symptoms, elevated ESR) occurs in 30% of patients
- aortic arch syndrome (involvement of subclavian and brachial branches of aorta resulting in pulseless disease), aortic aneurysm ± rupture are late complications

Medical Emergency
Untreated, GCA can lead to permanent blindness in 20-25% of patients
Treat on clinical suspicion

Investigations

- diagnosis made by clinical suspicion, increased ESR, increased CRP, temporal artery biopsy within 14 d of starting steroids, possible U/S

Treatment

- if suspect GCA, immediately start high dose prednisone 1 mg/kg in divided doses for approximately 4 wk, and then tapering prednisone as symptoms resolve; highly effective in treatment and in prevention of blindness and other vascular complications
- consider low dose ASA

Prognosis

- increased risk of thoracic aortic aneurysm and aortic dissection
- yearly CXR ± abdominal U/S as screening

Seronegative Rheumatic Disease

Table 25. A Comparison of the Spondyloarthropathies*

Feature	AS	PsA	ReA	EA
M:F	3:1	1:1	8:1	1:1
Age of Onset	20s	35-45	20s	Any
Peripheral Arthritis	25%	96%	90%	Common
Distribution	Axial, LE	Any	LE	LE
Sacroiliitis	100%	40%	80%	20%
Dactylitis	Uncommon	Common	Occasional	Uncommon
Enthesitis	Common	Common	Common	Less Common
Skin Lesions	Rare	100% Psoriasis eventually 70% at onset of arthritis	Common Keratoderma	Occasional Pyoderma, erythema nodosum
Uveitis	Common	Occasional	20%	Rare
Urethritis	Rare	Uncommon	Common	Rare
HLA-B27	90-95%	40%	80%	30%

LE = lower extremities

*Spondyloarthropathy: inflammatory joint disease of the vertebral column

Figure 10. Spondyloarthropathy subsets

Enthesitis: inflammation of tendon or ligament at site of attachment to bone

Consider AS in the differential for causes of aortic regurgitation

Rule of 2s

AS occurs in

- 0.2% of the general population
- 2% of HLA-B27 positive individuals
- 20% of HLA-B27 positive individuals with affected family member

Ankylosing Spondylitis

Definition

- chronic inflammatory arthritis involving the sacroiliac joints and vertebrae
- enthesitis is a major feature
- prototypical spondyloarthropathy

Table 26. ASAS Classification Criteria for Axial Spondyloarthritis*

Sacroiliitis on Imaging plus ≥1 AS Feature or HLA-B27 Positive plus ≥2 AS Features	
AS Features <ul style="list-style-type: none"> • HLA-B27 positive • Inflammatory back pain • Arthritis • Enthesitis (heel) • Uveitis • Dactylitis • Psoriasis • Crohn's disease/colitis • Good response to NSAIDs • Family history of AS • Elevated CRP 	Sacroiliitis on Imaging <ul style="list-style-type: none"> • Active (acute) inflammation on MRI highly suggestive of sacroiliitis associated with AS • Definite radiographic sacroiliitis ≥ grade 2 bilaterally or grade 3-4 unilaterally

*For patients with ≥3 mo back pain and age at onset <45 yr

Etiology and Pathophysiology

- inflammation → osteopenia → erosion → ossification → osteoproliferation (syndesmophytes)

- SI
- Spindylitis
- Hip
- Shoulder

© Linda Colati

Figure 11. Common sites of involvement of AS

Epidemiology

- M:F = 3:1; females have milder disease which may be under-recognized and more peripheral arthritis and upper spine spondylitis
- 90-95% of patients have HLA-B27 (9% HLA-B27 positive in general population)

Table 27. Types of Back Pain

Parameter	Mechanical	Inflammatory
Past History	±	++
Family History	–	+
Onset	Acute	Insidious
Age	15-90 yr	<40 yr
Sleep Disturbance	±	++ (worse during 2nd half of night)
Morning Stiffness	<30 min	>1 h
Involvement of Other Systems	–	+
Exercise	Worse	Better
Rest	Better	Worse
Radiation of Pain	Anatomic (L5-S1)	Diffuse (thoracic, buttock)
Sensory Symptoms	+	–
Motor Symptoms	+	–

Signs and Symptoms

- **axial**
 - mid and lower back stiffness, prolonged morning stiffness, night pain, persistent buttock pain, painful sacroiliac joint (+ FABER test)
 - spinal restriction (decreased ROM): lumbar (decreased Schöber), thoracic (decreased chest wall expansion, normal >5 cm at T4), cervical (global decrease, often extension first)
 - postural changes: decreased lumbar lordosis + increased thoracic kyphosis + increased cervical flexion = increased occiput to wall distance (>5 cm)
- **peripheral**
 - asymmetrical large joint arthritis, most often involving lower limb
 - enthesitis: tenderness over tibial tuberosity, or Achilles tendon and plantar fascia insertions into the calcaneus
- **extra-articular manifestations**
 - ophthalmic: acute anterior uveitis is common (25-30% patients)
 - renal: amyloidosis (late and rare), IgA nephropathy
 - gastrointestinal: IBD
 - cardiac: aortitis, aortic regurgitation, pericarditis, conduction disturbances, heart failure (rare)
 - respiratory: apical fibrosis (rare)
 - neurologic: cauda equina syndrome (rare)
 - skin: psoriasis

Investigations

- x-ray of SI joint: “pseudowidening” of joint due to erosion with joint sclerosis → bony fusion (late), symmetric sacroiliitis
- x-ray of spine: “squaring of edges” from erosion and sclerosis on corners of vertebral bodies (shiny corner sign) leading to ossification of outer fibres of annulus fibrosis (bridging syndesmophytes) → “bamboo spine” radiographically
- MRI of spine: assess activity in early disease; detection of cartilage changes, bone marrow edema, bone erosions, and subchondral bone changes. Best seen on T2 STIR (short tau inversion recovery) images (suppress fat and see bone edema)

Treatment

- **non-pharmacological therapy**
 - prevent fusion from poor posture and disability through: exercise (e.g. swimming), postural and deep breathing exercises, outpatient PT, smoking cessation
- **pharmacological therapy**
 - NSAIDs (first line of treatment)
 - glucocorticoids (topical eye drops, local injections)
 - DMARDs for peripheral arthritis (sulfasalazine, MTX)
 - biologics for axial and peripheral involvement
 - manage extra-articular manifestations
- **surgical therapy**
 - hip replacement, vertebral osteotomy for marked deformity

Figure 12. AS Postural Changes

The Bath Ankylosing Spondylitis Disease Activity Index (BASDAI) is a self-reported scoring system that focuses on fatigue, axial pain, peripheral pain, enthesitis, and morning stiffness

FABER (Flexion, ABduction, and External Rotation) Test
Passively flex, abduct, then gently externally rotate the leg. If pain is elicited during this movement, the location of the pain may help determine the location of the patient's pathology (e.g. hip joint, sacroiliac joint)

Schöber Test
Have patient stand erect with normal posture and locate the middle of the two posterior superior iliac spines. Mark 5 cm below this point and 10 cm above (total distance of 15 cm). Re-measure the distance between the two marks with the patient flexed forward at the spine. This distance should increase by at least 5 cm in normal patients

Extra-Articular Manifestations of AS

6 As
Atlanto-axial subluxation
Anterior uveitis
Apical lung fibrosis
Aortic incompetence
Amyloidosis (kidneys)
Autoimmune bowel disease (ulcerative colitis)

Prognosis

- spontaneous remissions and relapses are common and can occur at any age
- function may be excellent despite spinal deformity
- favourable prognosis if female and age of onset >40 yr
- early onset with hip disease may lead to severe disability; may require arthroplasty

Enteropathic Arthritis

- see [Gastroenterology](#), *Inflammatory Bowel Disease*, G19
- MSK manifestations in the setting of either ulcerative colitis or Crohn's disease include peripheral arthritis (large joint, asymmetrical), spondylitis, and hypertrophic osteoarthropathy
- non-arthritis MSK manifestations can occur 2° to steroid treatment of bowel inflammation (arthralgia, myalgia, osteoporosis, AVN)
- NSAIDs should be used cautiously as they may exacerbate bowel disease

Table 28. Comparing Features of Spondylitis vs. Peripheral Arthritis in EA

Parameter	Spondylitis	Peripheral Arthritis
HLA-B27 Association	Yes	No
Gender	M>F	M=F
Onset Before IBD	Yes	No
Parallels IBD Course	No	Yes
Type of IBD	UC=CD	CD

Both AS and EA feature symmetric sacroiliitis

Check "hidden" areas for psoriatic lesions (ears, hair line, umbilicus, gluteal cleft, nails)

Risks and Benefits of Tumour Necrosis Factor- α (TNF- α) Inhibitors in the Management of Psoriatic Arthritis (PsA): Systematic Review and Meta-analysis of Randomized Controlled Trials
J Rheumatol 2008;35:883-890
Study: Review of RCTs of adalimumab, etanercept, and infliximab used in patients with PsA.
Results: Six RCTs were included (n=982). All 3 TNF- α inhibitors were significantly more effective than placebo on the basis of Psoriatic Arthritis Response Criteria (PsARC) and American College of Rheumatology response criteria ACR20, ACR50, and ACR70 ratings. There were no significant differences between TNF- α inhibitors and placebo in the proportions of patients who withdrew for any reason (RR 0.48, 95% CI 0.20-1.18), or withdrawal due to adverse events (RR 2.14, 95% CI 0.73-6.27), serious adverse events (RR 0.98, 95% CI 0.55-1.77), or upper respiratory tract infections (RR 0.91, 95% CI 0.65-1.28). Pooled rates for injection site reactions were significantly higher for adalimumab and etanercept than for placebo (RR 2.48, 95% CI 1.16-5.29), but there was no significant difference in the proportion of patients experiencing infusion reactions with infliximab (RR 1.03, 95% CI 0.48-2.20) compared to placebo. Indirect analysis did not demonstrate any significant differences between the TNF- α inhibitors.
Conclusions: TNF- α inhibitors are effective treatments for PsA with no important added risks associated with their short-term use. There is still a need for long-term risk-benefit assessment of use of these drugs for the management of PsA.

Psoriatic Arthritis

Definition

- arthritic inflammation associated with psoriasis

Etiology and Pathophysiology

- unclear but many genetic, immunologic, and some environmental factors involved (e.g. bacterial, viral, and trauma)

Epidemiology

- psoriasis affects 1% of population
- arthropathy in 15% of patients with psoriasis
- 15-20% of patients will develop joint disease before skin lesions appear

Signs and Symptoms

- **dermatologic**
 - well-demarcated erythematous plaques with silvery scale
 - nail involvement: pitting, transverse or longitudinal ridging, discolouration, subungual hyperkeratosis, onycholysis, and oil drops
- **musculoskeletal**
 - 5 general patterns
 - ♦ asymmetric oligoarthritis (most common – 70%)
 - ♦ arthritis of DIP joints with nail changes
 - ♦ destructive (mutilans) arthritis (5%)
 - ♦ symmetric polyarthritis (similar to RA)
 - ♦ sacroiliitis and spondylitis (usually older, male patients)
 - other findings: dactylitis, enthesopathy
- **ophthalmic**
 - conjunctivitis, iritis (anterior uveitis)
- **cardiac and respiratory** (late findings)
 - aortic insufficiency
 - apical lung fibrosis
- **neurologic**
 - cauda equina syndrome
- **radiologic**
 - floating syndesmophytes
 - pencil-in-cup appearance at IP joints
 - osteolysis, periostitis

Treatment

- treat skin lesions (e.g. steroid cream, salicylic and/or retinoic acid, tar, UV light)
- NSAIDs or IA steroids
- DMARDs, biologic therapies to minimize erosive disease (use early if peripheral joint involvement)

Table 29. CASPAR Criteria for PsA*

Criterion	Description
1. Evidence of psoriasis	Current, past, or family history
2. Psoriatic nail dystrophy	Onycholysis, pitting, hyperkeratosis
3. Negative results for RF	
4. Dactylitis	Current or past history
5. Radiological evidence	Juxta articular bone formation on hand or foot x-rays

* To meet the CASPAR (Classification criteria for Psoriatic ARthritis) criteria, a patient must have inflammatory articular disease (joint, spine, or enthesal) with ≥ 3 points from the above 5 categories

Arthritis Rheum 2006 Aug;54(8):2665-73. Classification criteria for PsA: development

Reactive Arthritis

Definition

- two meanings
 - reactive arthritis: a sterile arthritis following an infection (e.g. rheumatic fever, post-viral arthritis, etc.), not used frequently by rheumatologists
 - reactive arthritis (ReA): one of the seronegative spondyloarthropathies in which patients have a peripheral arthritis (≥ 1 mo duration) accompanied by one or more extra-articular manifestations that appears shortly after certain infections of the GI or GU tracts

Etiology

- onset following an infectious episode either involving the GI or GU tract
 - GI: *Shigella*, *Salmonella*, *Campylobacter*, *Yersinia* species
 - GU: *Chlamydia* (isolated in 16-44% of ReA cases), *Mycoplasma* species
- acute clinical course
 - 1-4 wk post-infection
 - lasts weeks to years
 - often recurring
 - spinal involvement persists

Epidemiology

- in HLA-B27 patients, axial > peripheral involvement
- M>F

Signs and Symptoms

- musculoskeletal**
 - peripheral arthritis, asymmetric pattern, spondylitis, Achilles tendinitis, plantar fasciitis, dactylitis
- ophthalmic**
 - iritis (anterior uveitis), conjunctivitis
- dermatologic**
 - keratoderma blennorrhagicum (hyperkeratotic skin lesions on palms and soles) and balanitis circinata (small, shallow, painless ulcers of glans penis and urethral meatus) are diagnostic
- gastrointestinal**
 - oral ulcers, diarrhea
- urethritis and cervicitis**
 - sterile pyuria; presence not related to site of initiating infection

Investigations

- diagnosis is clinical plus laboratory
- blood work: normocytic, normochromic anemia, and leukocytosis
- sterile cultures
- serology: HLA-B27 positive

Treatment

- antibiotics for non-articular infections
- NSAIDs, physical therapy, exercise
- local therapy
 - joint protection
 - IA steroid injection
 - topical steroid for ocular involvement
- systemic therapy
 - corticosteroids, sulfasalazine, MTX (for peripheral joint involvement only)
 - TNF- α inhibitors for spinal inflammation

Prognosis

- self-limited, typically 3-5 mo, varies based on pathogen and patient's genetic background
- chronic in 15-20% of cases

Clinical Triad of Reactive Arthritis

- Arthritis
- Conjunctivitis/uveitis
- Urethritis/cervicitis

"Can't see, can't pee, can't climb a tree"

Triad of conjunctivitis, urethritis, and arthritis is 99% specific (but 51% sensitive) for ReA

Crystal-Induced Arthropathies

Table 30. Gout vs. Pseudogout

Parameter	Gout	Pseudogout
Gender	M>F	M=F
Age	Middle-aged males Post-menopausal females	Age >60 yr
Onset of Disease	Acute	Acute/insidious
Crystal Type	Monosodium urate Negative birefringence (yellow when parallel to compensator filter), needle-shaped	CPPD Positive birefringence (blue when parallel), rhomboid-shaped
Distribution	First MTP classically; also midfoot, ankle, knee, or polyarticular	Knee, wrist; monoarticular, or polyarticular if chronic
Radiology (note findings are non-specific)	Erosions	Chondrocalcinosis OA (knee, wrist, 2 nd and 3 rd MCP)
Treatment	Acute: NSAIDs, corticosteroids, colchicine Chronic: \pm allopurinol, febuxostat	NSAIDs, corticosteroids

Figure 13. Common sites of involvement in gout
(asymmetric joint involvement)

Gout

Definition

- derangement in purine metabolism resulting in hyperuricemia; monosodium urate crystal deposits in tissues (tophi) and synovium (microtophi)

Etiology and Pathogenesis

- sources of uric acid: diet and endogenous
- synthesis
 - hypoxanthine \rightarrow xanthine \rightarrow uric acid
 - both steps catalyzed by xanthine oxidase

Hyperuricemia

- primary or genetic**
 - mostly due to idiopathic renal underexcretion (90%)
 - also idiopathic overproduction or abnormal enzyme production/function
- secondary**
 - dietary excess (particularly high consumption of beer, seafood, and meat)
 - underexcretion (>90%): renal failure, drugs, systemic conditions
 - overproduction (<10%): increased nucleic acid turnover states (e.g. malignancy, post-chemotherapy)
- sudden changes (increasing or decreasing) in uric acid concentration are more important than absolute values
 - acute gout can occur with normal serum uric acid
 - changes in pH, temperature, or initiation of antihyperuricemics may precipitate an acute gouty attack
- common precipitants: alcohol, dietary excess, dehydration, drugs (e.g. thiazide and loop diuretics), trauma, illness, surgery, starting xanthine oxidase inhibitor therapy
- other associated conditions: HTN, obesity, DM, starvation

Epidemiology

- most common in males >45 yr
- extremely rare in premenopausal females

Signs and Symptoms

- single episode progressing to recurrent episodes of acute inflammatory arthritis
- acute gouty arthritis**
 - severe pain, redness, joint swelling, usually involving lower extremities
 - joint mobility may be limited
 - attack will subside spontaneously within several days to weeks; may recur
- tophi**
 - urate deposits on cartilage, tendons, bursae, soft tissues, and synovial membranes
 - common sites: first MTP, ear helix, olecranon bursae, tendon insertions (common in Achilles tendon)
- kidney**
 - gouty nephropathy
 - uric acid calculi

Investigations

- joint aspirate: >90% of joint aspirates show crystals of monosodium urate (negatively birefringent, needle-shaped)
- x-rays may show tophi as soft tissue swelling, punched-out lesions, erosions, with "overhanging"

- An acute gout attack may mimic cellulitis; however, joint mobility is preserved in cellulitis
- Gout often affects more than one joint (i.e. ankle, midfoot, and MTPs)

Precipitants of Gout

Drugs are FACT

Furosemide
 Aspirin®/Alcohol
 Cytotoxic drugs
 Thiazide diuretics

Foods are SALT

Seafood
 Alcohol (beer and spirits)
 Liver and kidney
 Turkey (meat)

- The majority of people with hyperuricemia do not have gout
- Normal or low uric acid levels do not rule out gout

10 Recommendations on the Diagnosis and Management of Gout

Ann of Rheum Dis 2013;73:328-335

- Identification of monosodium urate crystals should be performed for a definitive diagnosis of gout.
- Gout/hyperuricemia should prompt investigations of renal function and CV risk factors.
- Acute gout should be treated with colchicine, NSAIDs, and/or glucocorticoids.
- Patients should be counselled about lifestyle.
- Allopurinol is first line for urate lowering therapy, with uricosurics as second line.
- Patients should be informed about the risk of acute gout flare with initiation of urate lowering therapy; colchicine prophylaxis should be considered.
- Allopurinol can be used in patients with mild/moderate renal impairment with slow titration and monitoring.
- Treatment goal is urate <0.36 mM and absence of attacks and resolution of tophi.
- Tophi should be treated medically by lowering serum urate to <0.3 mM. Surgery is only for select cases.
- Prophylactic pharmacological management of asymptomatic hyperuricemia is not recommended.

Treatment

- **acute gout**
 - NSAIDs: high dose, then taper as symptoms improve
 - corticosteroids: IA, oral, or intra-muscular (if renal, cardiovascular, or GI disease and/or if NSAIDs contraindicated or failed)
 - colchicine within first 12 h but effectiveness limited by narrow therapeutic range
 - allopurinol can worsen an acute attack (do not start during acute flare)
- **chronic gout**
 - conservative
 - ♦ avoid foods with high purine content (e.g. visceral meats, sardines, shellfish, beans, peas)
 - ♦ avoid drugs with hyperuricemic effects (e.g. pyrazinamide, ethambutol, thiazide, alcohol)
 - medical
 - ♦ antihyperuricemic drugs (allopurinol and febuxostat): decrease uric acid production by inhibiting xanthine oxidase
 - ♦ uricosuric drugs (probenecid, sulfinpyrazone): use if failure on or intolerant to allopurinol; do not use in renal failure
 - prophylaxis prior to starting antihyperuricemic drugs (colchicine/low-dose NSAID)
 - in renal disease secondary to hyperuricemia, use low-dose allopurinol and monitor Cr
- indications for treatment with antihyperuricemic medications include
 - recurrent attacks, tophi, bone erosions, urate kidney stones
 - perhaps in renal dysfunction with very high urate load (controversial)

Pseudogout (Calcium Pyrophosphate Dihydrate Disease)

Definition

- joint inflammation caused by calcium pyrophosphate crystals

Etiology and Pathophysiology

- acute inflammatory arthritis due to phagocytosis of IgG-coated CPPD crystals by neutrophils and subsequent release of inflammatory mediators within joint space
- more frequently polyarticular
- slower in onset in comparison to gout, lasts up to 3 wk but is self-limited

Risk Factors

- old age, advanced OA, neuropathic joints
- other associated conditions: hyperparathyroidism, hypothyroidism, hypomagnesemia, hypophosphatasia (low ALP), DM, hemochromatosis

Signs and Symptoms

- affects knees, wrists, MCPs, hips, shoulders, elbows, ankles, big toe
- multiple manifestations
 - asymptomatic crystal deposition (seen on radiograph only)
 - acute crystal arthritis (self-limited flares of acute inflammatory arthritis resembling gout)
 - pseudo-OA (progressive joint degeneration, sometimes with episodes of acute inflammatory arthritis)
 - pseudo-RA (symmetrical polyarticular pattern with morning stiffness and constitutional symptoms)
- acute may be triggered by dehydration, acute illness, surgery, trauma

Investigations

- must aspirate joint to rule out septic arthritis, gout
- CPPD crystals: present in 60% of patients, often only a few crystals, positive birefringence (blue) and rhomboid shaped
- x-rays show chondrocalcinosis in 75%: radiodensities in fibrocartilaginous structures (e.g. knee menisci) or linear radiodensities in hyaline articular cartilage

Treatment

- joint aspiration, rest, and protection
- NSAIDs: also used for maintenance therapy
- prophylactic colchicine PO (controversial)
- IA or oral steroids to relieve inflammation

Figure 14. Common sites of involvement in CPPD

Non-Articular Rheumatism

Definition

- disorders that primarily affect soft tissues or periarticular structures
- includes bursitis, tendinitis, tenosynovitis, fibromyalgia, and PMR

Polymyalgia Rheumatica

Definition

- characterized by pain and stiffness of the proximal extremities (girdle area)
- closely related to GCA (15% of patients with PMR develop GCA)
- no muscle weakness

Table 31. PMR Classification Criteria Scoring Algorithm*

	Points without U/S (0-6)	Points with Abnormal U/S** (0-8)
Morning stiffness duration >45 min	2	2
Hip pain or limited ROM	1	1
Absence of RF or ACPA	2	2
Absence of other joint involvement	1	1
At least one shoulder with subdeltoid and/or biceps tenosynovitis and/or glenohumeral synovitis (either posterior or axillary) and at least one hip with synovitis and/or trochanteric bursitis on U/S	N/A	1
Both shoulders with subdeltoid bursitis, biceps tenosynovitis, or glenohumeral synovitis on U/S	N/A	1

*Required criteria: age ≥ 50 yr, bilateral shoulder aching, and abnormal ESR/CRP

**A score of 4 or more is categorized as PMR in the algorithm without U/S and a score of 5 or more is categorized as PMR in the algorithm with U/S

**Optional U/S criteria

Ann Rheum Dis 2012;71:484-492

Epidemiology

- incidence 50 per 100,000 per year in those >50 yr
- age of onset typically >50 yr, F:M = 2:1

Signs and Symptoms

- constitutional symptoms prominent (fever, weight loss, malaise)
- pain and stiffness of symmetrical proximal muscles (neck, shoulder and hip girdles, thighs)
- gel phenomenon (stiffness after prolonged inactivity)
- physical exam reveals tender muscles, but no weakness or atrophy

Investigations

- blood work: often shows anemia, elevated platelets, elevated ESR and CRP, and normal CK; up to 5% of PMR reported with normal inflammatory markers

Treatment

- goal of therapy: symptom relief
- start with prednisone dose of 15-20 mg PO OD, reconsider diagnosis if no response within several days
- taper slowly over 2 yr period monitoring ESR and symptoms closely
- relapses should be diagnosed and treated on clinical basis; do not treat a rise in ESR as a relapse
- treat relapses aggressively (50% relapse rate)
- monitor for steroid side effects, glucocorticoid-induced osteoporosis prevention, and follow for symptoms of GCA

Most patients are treated for up to 2 yr

Fibromyalgia

Definition

- chronic (>3 mo), widespread (axial, left- and right-sided, upper and lower segment), non-articular pain with characteristic tender points

Diagnosis

Table 32. 2010 ACR Preliminary Diagnostic Criteria for Fibromyalgia

Criteria	Comments
<p>Widespread Pain Index = number of areas in which the patient had pain over the last week (max score = 19): L and R: shoulder girdle, upper arm, lower arm, hip, upper leg, lower leg, jaw One Area: chest, abdomen, upper back, lower back, neck</p> <p>Symptom Severity Score = sum of: a) severity of fatigue b) waking unrefreshed c) cognitive symptoms over the past week d) extent of somatic symptoms (IBS, H/A, abdominal pain/cramps, dry mouth, fever, hives, ringing in ears, vomiting, heartburn, dry eyes, SOB, loss of appetite, rash, hair loss, easy bruising, etc.)</p> <p>all (a-d) rated on 0-3 scale: 0 = no problem, 1 = mild, 2 = moderate, 3 = severe</p>	<p>A patient satisfies diagnostic criteria for fibromyalgia if the following 3 conditions are met:</p> <ol style="list-style-type: none"> 1. Widespread Pain Index (WPI) ≥ 7 and Symptom Severity (SS) scale score ≥ 5 or WPI 3-6 and SS scale score ≥ 9 2. Symptoms have been present at a similar level for at least 3 mo 3. The patient does not have a disorder that would otherwise explain the pain

Arthritis Care and Research 2010;62(5):600-610

Epidemiology

- F:M = 3:1
- primarily ages 25-45 yr, some adolescents
- prevalence of 2-5% in general population
- overlaps with chronic fatigue syndrome and myofascial pain syndrome
- strong association with psychiatric illness

Signs and Symptoms

- widespread aching, stiffness
- easy fatigability
- sleep disturbance: non-restorative sleep, difficulty falling asleep, and frequent waking
- symptoms aggravated by physical activity, poor sleep, emotional stress
- patient feels that joints are diffusely swollen although joint examination is normal
- neurologic symptoms of hyperalgesia, paresthesias
- associated with irritable bowel or bladder syndrome, migraines, tension H/As, restless leg syndrome, obesity, depression, and anxiety
- physical exam should reveal only tenderness with palpation of soft tissues, with no specificity for trigger/tender points

Investigations

- blood work: includes TSH and ESR; all typically normal unless unrelated, underlying illness present
- serology: do not order ANA or RF unless there is clinical suspicion for a connective tissue disease
- laboratory sleep assessment

Differential Diagnosis

- diagnosis of exclusion
- rule out other disorders by history and physical exam (RA, SLE, PMR, myositis, hypothyroidism, hyperparathyroidism, neuropathies)

Treatment

- non-pharmacological therapy**
 - education
 - exercise program (walking, aquatic exercises), physical therapy (good posture, stretching, muscle strengthening, massage)
 - stress reduction, CBT
 - no evidence for alternative medicine such as biofeedback, meditation, acupuncture

A 14 Week, RCT of Pregabalin in Patients with Fibromyalgia

J Pain 2008;9:792-880

Study: Multicentre RCT. 750 patients with fibromyalgia with pain score of <40 mm on the visual analog scale (VAS) were assigned to placebo or pregabalin (300 mg, 450 mg, or 600 mg) daily for 12 wk.

Primary Outcome: Change in the mean pain score derived from the subject's daily pain diary as measured at the patient's baseline to the end point of the study.

Results: Patients treated with 300, 450 and 600 mg/d pregabalin showed a statistically significant improvement in the end point mean pain score compared with placebo-treated subjects. Discontinuations due to adverse events were 12%, 16%, 22%, and 26% in placebo, 300 mg/d, 450 mg/d, and 600 mg/d respectively. The 450 and 600 mg/d groups were significantly different from placebo ($p=0.0001$).

Conclusions: Pregabalin at 300 mg/d, 450 mg/d, and 600 mg/d showed statistically significant response rates as compared to placebo although discontinuation rates for the 450 mg/d and 600 mg/d regimens were significantly higher as compared to placebo.

Exercise for Treating Fibromyalgia Syndrome

Cochrane DB Syst Rev 2008;CD003786

Study: Systematic review of exercise training including cardiorespiratory endurance, muscle strengthening, and flexibility for global well-being and physical function in patients with fibromyalgia.

Result: 34 studies were included ($n=2,276$). Aerobic-only exercises improve global well-being, physical function, and possibly pain and tender points. There was insufficient data to evaluate the effect of strength and flexibility on the primary outcomes.

Conclusions: Moderate aerobic cardiorespiratory exercise improves function and well-being in patients with fibromyalgia. Benefits from muscle strengthening and flexibility require additional research to delineate benefits.

- **pharmacological therapy**
 - low dose tricyclic antidepressant (e.g. amitriptyline)
 - ♦ for sleep restoration
 - ♦ select those with lower anticholinergic side effects
 - SNRI: duloxetine, milnacipran
 - anticonvulsant: pregabalin, gabapentin
 - analgesics may be beneficial for pain that interferes with sleep (NSAIDs, not narcotics)

Prognosis

- variable; usually chronic, unless diagnosed and treated early

Adult Onset Still's Disease

Definition

- systemic inflammatory condition (ANA and RF negative) with fevers and characteristic rash, numerous systemic symptoms, and may have severe arthritis

Etiology and Pathophysiology

- idiopathic; infectious triggers likely – various viruses and bacteria have been implicated
- stress increases risk

Epidemiology

- F>M; age of onset typically 16-40, approximately 1 per 100,000

Signs and Symptoms

- classic triad of symptoms
 - high-spiking fevers (95.7% of patients, typically T = 39°C, <4 h duration, quotidian pattern)
 - characteristic "salmon rash" (~72% of patients, on proximal limbs + trunk)
 - arthralgia/arthritis (64-100%)
 - ♦ arthritis is symmetric, typically affects large joints, i.e. wrists, knees and ankles, may involve PIP and DIPs, elbow, MTPs
- sore throat, myalgias and serositis may also occur
- liver abnormalities ± hepatomegaly (50-75% patients)
- splenomegaly (44%)

Classification

- numerous classification systems proposed

Table 33. Yamaguchi's Criteria for Classification of Adult Still's Disease

Major Criteria	Minor Criteria
T > 39°C, intermittent, >1 wk Arthralgias/arthritis ≥2 wks Typical rash WBC > 10,000 (>80% granulocytes)	Sore throat Lymphadenopathy Hepatomegaly or splenomegaly Abnormal transaminases Negative ANA and RF

Need 5 criteria for diagnosis, at least 2 major. Exclusion criteria: infection, malignancy, rheumatic disease

J Rheumatol 1992;19:424-30

Investigations

- ANA and RF negative
- markedly elevated ESR, CRP, ferritin (typically >1000 ng/mL)
 - total ferritin >5x ULN = 80% sensitive, 41% specific
- anemia, thrombocytosis, leukocytosis may occur
- transaminases, LDH may be elevated

Treatment

- biologics (anti-IL-1 and anti-IL-6 agents)
- begin management with low-dose glucocorticoids ± MTX

Triad of Still's Disease

FAR

Fever
Arthralgias/Arthritis
Rash

Common Medications

Table 34. Common Medications for Osteoarthritis

Class	Generic Drug Name	Trade Name	Dosing (PO)	Indications	Contraindications	Adverse Effects
Analgesic	acetaminophen	Tylenol®	500 mg tid q4h (4 g daily max)	1 st line		Hepatotoxicity Overdose Potentiates warfarin
NSAIDs	ECASA	Entrophen®	325-975 mg qid	2 nd line	GI bleed	Nausea, tinnitus, vertigo, rash, dyspepsia, GI bleed, PUD, hepatitis, renal failure, HTN, nephrotic syndrome
	ibuprofen	Advil,® Motrin®	200-600 mg tid		Renal impairment	
	diclofenac	Voltaren®	25-50 mg tid		Allergy to ASA, NSAIDs	
	diclofenac/misoprostol	Arthrotec®	50-75/200 mg tid		Pregnancy (T3)	
	naproxen	Naprosyn®, Aleve®	125-500 mg bid			
	meloxicam	Mobicox®	7.5-15 mg OD			
COX-2 INHIBITORS						
	celecoxib	Celebrex®	200 mg OD	High risk for GI bleed: age >65 Hx of GI bleed, PUD	Renal impairment Sulfa allergy (celecoxib) Cardiovascular disease	Delayed ulcer healing Renal/hepatic impairment Rash
Other Treatments		Comments				
Combination analgesics (acetaminophen + codeine, acetaminophen + NSAIDs)		Enhanced short-term effect compared to acetaminophen alone More adverse effects: sedation, constipation, nausea, GI upset				
IA corticosteroid injection		Short-term (weeks-months) decrease in pain and improvement in function Used for management of an IA inflammatory process when infection has been ruled out				
IA hyaluronic acid q6mo		Used for mild-moderate OA of the knees, however little supporting evidence, and not considered to be effective Precaution with chicken/egg allergy				
Topical NSAIDs		25% wt/wt topical diclofenac (Pennsaid®) May use for patients who fail acetaminophen treatment and who wish to avoid systemic therapy				
Capsaicin cream		Mild decrease in pain				
Glucosamine sulfate ± chondroitin		Limited clinical studies No regulation by Health Canada				

Table 35. Disease Modifying Anti-Rheumatic Drugs (DMARDs)

Generic Drug Name	Trade Name	Dosing	Contraindications	Adverse Effects
COMMONLY USED				
hydroxychloroquine \$	Plaquenil®	400 mg PO OD initially 200-400 mg PO OD maintenance (6.5 mg/kg ideal body weight per day)	Retinal disease, G6PD deficiency	GI symptoms, skin rash, macular damage, neuromyopathy Requires regular ophthalmological screening to monitor for retinopathy
sulfasalazine \$	Salazopyrim® Azulfidine® (US)	1000 mg PO bid-tid	Sulfa/ASA allergy, kidney disease, G6PD deficiency	GI symptoms, rash, H/A, leukopenia
methotrexate \$	Rheumatrex® Folex/Mexate®	7.5-25 mg PO/IM/SC qweekly	Bone marrow suppression, liver disease, significant lung disease, immunodeficiency, pregnancy, EtOH abuse	Oral ulcers, GI symptoms, cirrhosis, myelosuppression, pneumonitis, tubular necrosis
leflunomide \$\$	Arava®	10-20 mg PO OD	Liver disease	Alopecia, GI symptoms, liver dysfunction, pulmonary infiltrates
NOT COMMONLY USED				
cyclosporine \$\$	Neoral®	2.5-3 mg/kg/d divided and given in 2 doses PO	Kidney/liver disease, infection, HTN	HTN, decreased renal function, hair growth, tremors, bleeding
gold (injectable) \$	Solganal® Mycrysine®	50 mg IM q1wk after gradual introduction	IBD, kidney/liver disease	Rash, mouth soreness/ulcers, proteinuria, marrow suppression
azathioprine \$	Imuran®	2/5 mg/kg/d PO once daily	Kidney/liver disease TPMT deficiency	Rash, pancytopenia (especially ↓ WBC, ↑ AST, ALT), biliary stasis, vomiting, diarrhea
cyclophosphamide \$	Cytoxan®	1 g/m ² /mo IV as per protocol	Kidney/liver disease	Cardiotoxicity, GI symptoms, hemorrhagic cystitis, nephrotoxicity, bone marrow suppression, sterility

Table 35. Disease Modifying Anti-Rheumatic Drugs (DMARDs) (continued)

Generic Drug Name	Trade Name	Dosing	Mechanism of Action
NEWER DMARDs (Biologics)			
etanercept \$\$\$	Enbrel®	25 mg biweekly or 50 mg weekly SC	Fusion protein of TNF receptor and Fc portion of IgG
infliximab \$\$\$	Remicade®	3-5 mg/kg IV q8wk	Chimeric mouse/human monoclonal anti-TNF
adalimumab \$\$\$	Humira®	40 mg SC q2wk	Monoclonal anti-TNF
abatacept \$\$\$	Orencia®	IV infusion	Costimulation modulator of T-cell activation
rituximab \$\$\$	Rituxan®	2 IV infusions, 2 wk apart	Causes B-cell depletion, binds to CD20
certolizumab \$\$\$	Cimzia®	400 mg SC q2wk x3 then 200 mg SC q4wk	PEGylated monoclonal anti-TNF
golimumab \$\$\$	Simponi®	50 mg SC q mo	Monoclonal anti-TNF
tocilizumab \$\$\$	Actemra®	4-8 mg/kg IV q4wk	Interleukin-6 receptor antagonist

Risks of Biologics

- Reactivation of TB or hepatitis B. Patients require negative TB skin test, chest x-ray and negative hepatitis B virus serology prior to starting any of these medications
- Increased risk of serious infections
- Worsening heart failure

Landmark Rheumatology Trials

Trial	Reference	Results
RHEUMATOID ARTHRITIS		
ATTEST	<i>Ann Rheum Dis</i> 2008; 67:1096-103	Abatacept and infliximab have similar efficacy in RA patients who have failed MTX
ATTRACT	<i>Lancet</i> 1999; 354:1932-9	Infliximab and MTX combined are more effective than MTX alone for patients with active RA
CIMESTRA	<i>Arthritis Rheum</i> 2006; 54:1401-9	Combination of MTX and sulfasalazine is superior to either alone
COMET	<i>Lancet</i> 2008; 372:375-82	Etanercept add-on therapy increases rates of remission in early RA
ERA	<i>NEJM</i> 2000; 343:1586-93	Etanercept more rapidly decreases symptoms in early RA compared to MTX
European Leflunomide Study Group	<i>Lancet</i> 1999; 353:259-66	Leflunomide is equal in efficacy to sulphasalazine
FIN-RACo	<i>Lancet</i> 1999; 353:1568-73	Combination therapy with DMARDs improves remission rates in early RA
Infliximab and MTX	<i>NEJM</i> 2000; 343:1594-602	Infliximab combined with MTX reduces joint damage in RA
Leflunomide Rheumatoid Arthritis Investigators Group	<i>Arch Intern Med</i> 1999; 159:2542-50	Leflunomide is equivalent to MTX therapy and superior to placebo
PREMIER	<i>Arthritis Rheum</i> 2006; 54:26-37	Combination therapy with adalimumab and MTX is superior to either alone in patients with early RA
Swefot	<i>Lancet</i> 2009; 374:459-66	Anti-TNF agents are more effective second-line therapy than DMARDs in patients who fail MTX
OSTEOARTHRITIS		
GAIT	<i>NEJM</i> 2006; 354:795-808	Glucosamine, chondroitin, and the combination of both are no more effective than placebo in treatment of knee OA
Hyaluronan	<i>Ann Rheum Dis</i> 2010; 69:1097-102	Hyaluronan injections do not improve disease activity in patients with moderate-severe knee OA
SLE		
Belimumab	<i>Lancet</i> 2011; 377:721-31	Treatment with belimumab reduces the incidence of BILAG A and B flares in patients with SLE compared to placebo
BILAG open-RCT	<i>Rheumatology</i> 2010; 49:723-32	Low dose cyclosporine and azathioprine are equivalent in efficacy as maintenance therapy for SLE
Mycophenylate mofetil or intravenous cyclophosphamide	<i>NEJM</i> 2005; 353:2219-28	Mycophenylate mofetil is more efficacious than cyclophosphamide in inducing remission of SLE nephritis
CONNECTIVE TISSUE DISEASES		
Azathioprine or MTX maintenance for ANCA-associated vasculitis	<i>NEJM</i> 2008; 359:2790-803	MTX and azathioprine are equally safe and effective as maintenance agents in ANCA vasculitis

Trial	Reference	Results
Cyclophosphamide in scleroderma lung disease	<i>NEJM</i> 2006; 354:2655-66	Cyclophosphamide therapy leads to transient improvements in lung function, skin scores, and overall health in patients with scleroderma
Etanercept plus standard therapy for granulomatosis with polyangiitis	<i>NEJM</i> 2005; 352:351-61	Etanercept is not effective in inducing remission in patients with ANCA vasculitis
Mycophenylate mofetil vs. azathioprine for maintenance in ANCA-associated vasculitis	<i>JAMA</i> 2010; 304:2381-8	Mycophenylate mofetil is less effective than azathioprine for maintaining disease in ANCA-associated vasculitis
Rituximab versus cyclophosphamide for ANCA-associated vasculitis	<i>NEJM</i> 2010; 363:221-32	Rituximab is not inferior to cyclophosphamide for induction of remission in ANCA vasculitis
GOUT		
Febuxostat vs. allopurinol	<i>NEJM</i> 2005; 353:2450-61	Febuxostat is more effective than allopurinol at lowering serum urate, and has similar effectiveness on flare reduction
ANKYLOSING SPONDYLITIS		
Adalimumab	<i>Arthritis Rheum</i> 2006; 54:2136-46	Adalimumab induced partial remission in 22% of AS patients
ASSERT (rituximab)	<i>Arthritis Rheum</i> 2005; 52:582-91	Sixty percent of patients treated with rituximab had a clinical response to the medication
ATLAS (adalimumab)	<i>J Rheumatol</i> 2008; 35:1346-53	Compared to placebo, adalimumab significantly reduces pain and fatigue in AS patients
Infliximab in AS	<i>Lancet</i> 2002; 359:1187-93	Infliximab induces regression of symptoms in 50% of patients and is superior to placebo
SPINE (etanercept)	<i>Ann Rheum Dis</i> 2011; 70:799-804	Etanercept has short-term efficacy for patients with advanced AS and reduces disease severity
Sulfasalazine	<i>Arthritis Rheum</i> 1995; 38:618-27	Sulfasalazine is superior to placebo in treatment of patients with seronegative spondyloarthropathy

CHF	congestive heart failure	IFN-α	interferon-alpha	PVD	peripheral vascular disease		ureteroscopy
CIC	clean intermittent catheterization	IL-2	interleukin-2	PVR	post-void residual		urinary tract infection
CIS	carcinoma <i>in situ</i>	IPSS	International Prostate Symptom Score	QOL	quality of life		ureterovesicular junction
CMG	cystometrogram			RCC	renal cell carcinoma		voided bladder, initial (urethra)
CPPS	chronic pelvic pain syndrome	ISD	intrinsic sphincter deficiency	RFA	radio-frequency ablation		voided bladder, midstream (bladder)
CTU	CT urography	IUI	intrauterine insemination	RP	radical prostatectomy		voided bladder, post-massage/digital rectal exam
CUA	Canadian Urological Association	IVF	<i>in vitro</i> fertilization	RPLND	retroperitoneal lymph node dissection		voiding cystourethrogram
CVA	costovertebral angle	IVP	intravenous pyelogram	RTA	renal tubular acidosis		visual internal urethrotomy
d/c	discharge	KUB	kidneys, ureters, bladder	RUG	retrograde urethrogram		vesicoureteral reflux
DHT	dihydrotestosterone	LFT	liver function test	SA	semen analysis		
DMSA	dimercaptosuccinic acid	LMN	lower motor neuron	SCC	squamous cell carcinoma		
DRE	digital rectal exam	LUTS	lower urinary tract symptoms	SUI	stress urinary incontinence		
DSD	detrusor sphincter dyssynergia	MAG3	mercaptoacetyltriglycine	TMP/SMX	trimethoprim/sulfamethoxazole		
EBRT	external beam radiation therapy			TRUS	transrectal ultrasound		

Basic Anatomy Review

- recall that the anatomical position of the penis is erect; therefore, the anatomical ventral side of the penis appears to be the dorsal side of the flaccid penis

Figure 1. Midline cross-section of abdominal wall

Figure 2. Anatomy of scrotum

Figure 3. Essential male genitourinary tract anatomy

Figure 4. Cross section of the penis

Figure 5. Median sagittal section of the male pelvis and perineum

Urologic History

- follow the OPQRSTUVW approach
 - note that pain may not be limited to the genital region (e.g. lower abdomen, CVA)
- inquire about risk factors: past urologic disease (e.g. UTI, stones, STI, cancers, anatomic abnormalities, family Hx, medications, lifestyle factors, trauma, previous surgical procedures)
- urinary habits
 - frequency of voiding, quality of urine, volume of voids, incontinence, nocturia
 - specific urinary symptoms include
 - ♦ storage symptoms: frequency, nocturia, urgency
 - ♦ voiding symptoms: straining, hesitancy, dysuria, intermittency, post-void dribbling, reduced stream, feeling of incomplete voiding
 - ♦ hematuria: part of stream during which bleeding occurs, blood clots
 - ♦ incontinence: rushing to washroom (urge); leakage with coughing, sneezing, laughing (stress); constant dribbling (overflow)
- sexual function
 - scrotal mass: see *Scrotal Mass*, U29
 - ED: see *Erectile Dysfunction*, U30
 - infertility: see *Infertility*, U34
- risk factors
 - past urologic disease (e.g. UTI, stones, cancers, STI), anatomic abnormalities, trauma, previous surgical procedures, medications, family Hx, lifestyle factors
- associated symptoms
 - N/V
 - bowel dysfunction
- constitutional symptoms
 - fever, chills, unintentional weight loss, night sweats, fatigue, malaise

Always ask about sexual function on history. Change in erectile function can be one of the first symptoms that there is concomitant vascular disease. If there is new onset ED, consider screening for DM and CAD risk factors

Hematuria (Blood in the Urine)

Macroscopic (Gross) Hematuria

Definition

- blood in the urine that can be seen with the naked eye

Classification

- see [Nephrology](#), NP20

Etiology

Table 1. Etiology by Age Group

Age (yr)	Etiology
0-20	UTI, glomerulonephritis, congenital abnormalities
20-40	UTI, stones, bladder tumour
40-60	Male: bladder tumour, stones, UTI Female: UTI, stones, bladder tumour
>60	Male: BPH, bladder tumour, UTI, RCC Female: bladder tumour, UTI, RCC

Table 2. Etiology by Type

Pseudohematuria	Infectious/ Inflammatory	Malignancy	Benign	Structural	Hematologic
Vaginal bleeding	Pyelonephritis	RCC (mainly in adult population)	BPH	Stones	Anticoagulants
Dyes (beets, rhodamine B in candy and juices)	Cystitis	UCC	Polyps	Trauma	Coagulation defects
Hemoglobin (hemolytic anemia)	Urethritis	Wilms' tumour (mainly in pediatric population)	Exercise-induced	Foreign body	Sickle cell disease
Myoglobin (rhabdomyolysis)	Glomerulonephritis	Leukemia		Urethral stricture	Thromboembolism
Drugs (rifampin, phenazopyridine, phenytoin)	Interstitial nephritis			Polycystic kidneys	
Porphyrria	Tuberculosis			Arteriovenous malformation	
Laxatives (phenolphthalein)				Infarct	

History

- inquire about timing of hematuria in urinary stream
 - initial: anterior urethra
 - terminal: bladder neck and prostatic urethra
 - total: bladder and/or above

Investigations

- CBC (rule out anemia, leukocytosis), electrolytes, Cr, BUN, INR, PTT
- urine studies
 - U/A, C&S, cytology
- imaging
 - CT (with contrast) has largely replaced IVP to investigate upper tracts
 - consider contraindications to contrast: allergy, renal insufficiency
 - U/S alone is not sufficient
 - cystoscopy to investigate lower tract (possible retrograde pyelogram)

Acute Management of Severe Bladder Hemorrhage

- manual irrigation via catheter with normal saline to remove clots
- CBI using large (22-26 Fr) 3-way Foley to help prevent clot formation
- cystoscopy if active bleeding
 - identify resectable tumours
 - coagulate obvious sites of bleeding
- refractory bleeding
 - intravesical agents
 - continuous intravesical irrigation with 1% aluminum potassium sulfate solution as needed
 - intravesical instillation of 1% silver nitrate solution
 - intravesical instillation of 1-4% formalin (requires GA and pre-procedure cystogram to rule out reflux)
 - embolization or ligation of iliac arteries
 - cystectomy and diversion (rarely performed)

Gross, painless hematuria in adults is bladder cancer until proven otherwise

Common Urologic Causes of Hematuria can be Classified as:

TICS

Trauma/Tumour/Toxins
Infection/Inflammatory
Calculi/Cysts
Surgery/Sickle cell and other hematological causes

Upper Tract Imaging Options

CT Urography (CTU): Optimal test for renal parenchyma, calculi, and infections. Involves exposure to radiation and IV contrast. Assess kidney function, allergies prior to use of contrast

U/S: Superior to IVP for evaluation of renal parenchyma and renal cysts. Limited sensitivity for UCC and small renal masses. U/S alone is not sufficient for upper tract imaging

Intravenous Pyelogram (IVP):

Traditional option but rarely used (replaced by CTU). Reasonable sensitivity for UCC, but poor sensitivity for RCC

Microscopic Hematuria

Definition

- blood in the urine that is not visible to the naked eye
- >3 RBCs/HPF on urinalysis of at least two separate samples

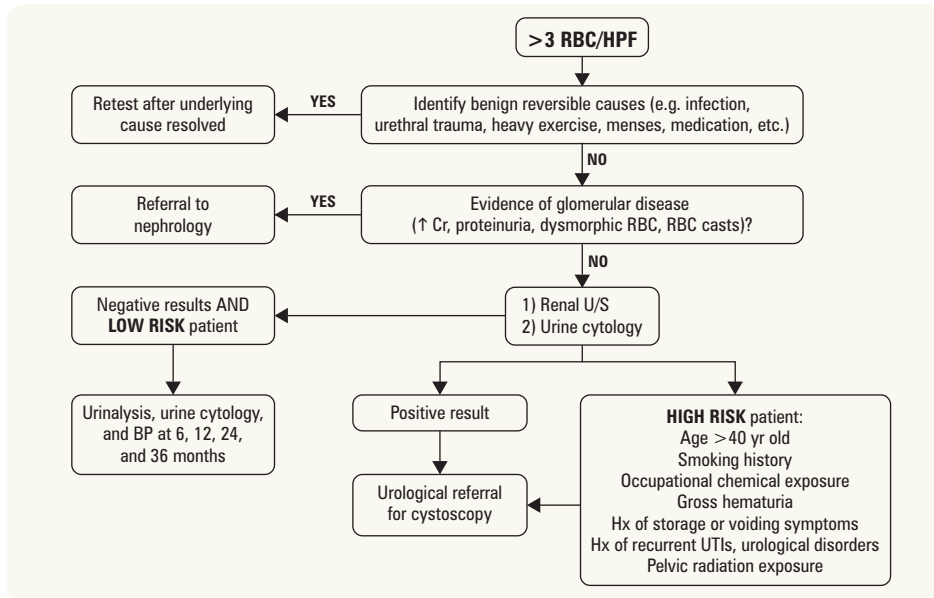

Figure 6. Workup of asymptomatic microscopic hematuria

Based on CUA Guidelines. Alternatively, the AUA recommends cystoscopy and CT urogram for all patients with confirmed microscopic hematuria; follow-up for negative workup is urinalysis yearly for two years, with repeat anatomic evaluation if microscopic hematuria persists

Lower Urinary Tract Dysfunction

- see [Gynecology](#), GY37 for relevant female topics

Voiding

- two phases of lower urinary tract function
 1. storage phase (bladder filling and urine storage)
 - ♦ accommodation and compliance
 - ♦ no involuntary contraction
 2. voiding phase (bladder emptying)
 - ♦ coordinated detrusor contraction
 - ♦ synchronous relaxation of outlet sphincters
 - ♦ no anatomic obstruction
- voiding dysfunction can therefore be classified as
 - failure to store: due to bladder or outlet
 - failure to void: due to bladder or outlet
- three types of symptoms
 - storage (formerly known as irritative)
 - voiding (formerly known as obstructive)
 - post-voiding

Urinary Incontinence

Definition

- involuntary leakage of urine

Etiology

- urgency incontinence
 - detrusor overactivity
 - ♦ CNS lesion, inflammation/infection (cystitis, stone, tumour), bladder neck obstruction (tumour, stone), BPH, idiopathic

Lower Urinary Tract Symptoms (LUTS)

Storage (FUND)

Frequency
Urgency
Nocturia
Dysuria

Voiding (SHED)

Stream changes
Hesitancy
Incomplete Emptying
Dribbling

- decreased compliance of bladder wall (inability to store urine)
 - CNS lesion, fibrosis
 - sphincter/urethral problem
- stress urinary incontinence (SUI)
 - common in women; seen in men after prostate cancer treatment or pelvic operations
 - urethral hypermobility
 - weakened pelvic floor and musculofascial urethral and vaginal supporting mechanisms allows bladder neck and urethra to descend with increased intra-abdominal pressure
 - urethra is pulled open by greater motion of posterior wall of outlet relative to anterior wall
 - associated with childbirth, pelvic surgery, aging, levator muscle weakness, obesity
 - intrinsic sphincter deficiency (ISD): weakness of the urethra and associated smooth and striated muscle elements
 - pelvic surgery, neurologic problem, aging and hypoestrogen state
 - ISD and urethral hypermobility can co-exist
- mixed incontinence
 - combination of stress and urgency incontinence
- overflow incontinence
 - is a term sometimes used to describe urinary incontinence as a complication of urinary retention; for causes of urinary retention see Table 4
 - use of the term should be accompanied by the associated pathophysiology (e.g. BPH with overflow incontinence)

Epidemiology

- variable prevalence in women: 25-45%
- F:M = 2:1
- more frequent in the elderly, affecting 5-15% of those living in the community and 50% of nursing home residents

Table 3. Urinary Incontinence: Types and Treatments

Type	Urgency	Stress	Mixed
Definition	Involuntary leakage of urine preceded by a strong, sudden urge to void	Involuntary leakage of urine with sudden increases in intra-abdominal pressure	Urinary leakage associated with urgency and increased intra-abdominal pressure
Etiology	Bladder (detrusor overactivity)	Urethra/sphincter weakness, post-partum pelvic musculature weakness	Combination of bladder and sphincter issues
Diagnosis	Hx Urodynamics	Hx Urodynamics Stress test (have patient bear down/cough)	Hx Urodynamics Stress test
Therapy	Lifestyle changes (fluid alterations, diet, etc.) Bladder habit training Anticholinergics β3 agonist Neuromodulation Botulinum toxin A	Weight loss Kegel exercises Bulking agents Surgery (slings, tension-free vaginal tape, transobturator tape, artificial sphincters)	Combination of management of urge and stress incontinence

Causes of Reversible Urinary Incontinence

DIAPERS

Delirium
Inflammation/Infection
Atrophic vaginitis/urethritis
Pharmaceuticals/Psychological
Excess U/O
Restricted mobility/Retention
Stool impaction

Urgency is the symptom of a strong need to void; it is not necessarily associated with incontinence

Urinary Retention

Table 4. Etiology of Urinary Retention

Outflow Obstruction	Bladder Innervation	Pharmacologic	Infection
<ul style="list-style-type: none"> Bladder neck or urethra: calculus, clot, foreign body, neoplasm, neurological (DSD) Prostate: BPH, prostate cancer Urethra: stricture, phimosis, traumatic disruption Miscellaneous: constipation, pelvic mass 	<ul style="list-style-type: none"> Intracranial: CVA, tumour, Parkinson's, cerebral palsy Spinal cord: injury, disc herniation, MS DM Post-abdominal or pelvic surgery 	<ul style="list-style-type: none"> Anticholinergics Narcotics Antihypertensives (ganglionic blockers, methylidopa) OTC cold medications containing ephedrine or pseudoephedrine Antihistamines Psychosomatic substances (e.g. ecstasy) 	<ul style="list-style-type: none"> GU: UTI, prostatitis, abscess, genital herpes Infected foreign body Varicella zoster

Clinical Features

- suprapubic pain
- palpable and/or percussible bladder (suprapubic)
- possible purulent/bloody meatal discharge
- increased size of prostate or reduced anal sphincter tone on DRE
- neurological: presence of abnormal or absent deep tendon reflexes, reduced "anal wink", saddle anesthesia

Acute vs. Chronic Retention

Acute retention is a medical emergency characterized by suprapubic pain and anuria with normal bladder volume and architecture

Chronic retention can be painless with greatly increased bladder volume and detrusor hypertrophy followed by atony (late)

If a trauma patient is unable to void, has blood at urethral meatus, a scrotal hematoma, or a high riding prostate, there is urethral injury until proven otherwise so catheterization is CONTRAINDICATED unless performed by urology staff or resident

Investigations

- CBC, electrolytes, Cr, BUN, U/A and urine C&S, U/S, cystoscopy, urodynamic studies, PVR

Treatment

- treat underlying cause
- catheterization
 - acute retention
 - ♦ immediate catheterization to relieve retention; leave Foley in to drain bladder; follow-up to determine cause; closely monitor fluid status and electrolytes (risk of POD)
 - chronic retention
 - ♦ intermittent catheterization by patient may be used; definitive treatment depends on etiology
- suprapubic tube placement
- for post-operative patients with retention:
 - encourage ambulation
 - α -blockers to relax bladder neck outlet
 - may need catheterization
 - definitive treatment will depend on etiology

Patients with ascites may have a falsely elevated PVR measured by bladder scan

Benign Prostatic Hyperplasia

Definition

- periurethral hyperplasia of stroma and epithelium in prostatic transition zone
- prostatic smooth muscle cells play a role in addition to hyperplasia

Etiology

- etiology unknown
 - DHT required (converted from testosterone by 5- α reductase)
 - possible role of impaired apoptosis, estrogens, other growth factors
 - genetic: increased risk in 1st degree relatives and twin studies

Epidemiology

- age-related, extremely common (50% of 50 yr olds, 80% of 80 yr olds)
- 25% of men will require treatment

Clinical Features

- result from outlet obstruction and compensatory changes in detrusor function
- voiding and storage symptoms
- DRE
 - prostate is smooth, rubbery, and symmetrically enlarged
- complications
 - retention
 - overflow incontinence
 - hydronephrosis
 - renal insufficiency
 - infection
 - gross hematuria
 - bladder stones

Investigations

- Hx, assessing LUTS and impact on QOL
 - may include self-administered questionnaires (IPSS or AUA symptom index for severity, progression, and treatment response)
- P/E, including DRE
- U/A to exclude UTI
- Cr to assess renal function
- renal U/S to assess for hydronephrosis
- PSA to rule out malignancy (see *Prostate Cancer Screening*, U25)
- uroflowmetry to measure flow rate (optional)
- PVR (optional)
- consider cystoscopy or transrectal ultrasound prior to potential surgical management to evaluate outlet and prostate volume
- biopsy if suspicious for malignancy, i.e. elevated PSA or abnormal DRE

Figure 7. Cross-section of prostate

Prostate size does not correlate well with symptoms in BPH

Approximate Prostate Sizes

- 20 cc – chestnut
- 25 cc – plum
- 50 cc – lemon
- 75 cc – orange
- 100 cc – grapefruit

AUA BPH Symptom Score

FUNWISE

- Frequency
- Urgency
- Nocturia
- Weak stream
- Intermittency
- Straining
- Emptying, incomplete feeling of

Each symptom graded out of 5
 0-7: Mildly symptomatic
 8-19: Moderately symptomatic
 20-35: Severely symptomatic

Note: dysuria not included in score but is commonly associated with BPH

Treatment

Table 5. Treatment of BPH

	Conservative	Medical	Surgical	Minimally Invasive Surgical Therapies
When to use	Asymptomatic patients	Moderate to severe symptoms that are distressing for patient	Significant symptom burden, acute urinary retention, refractory hematuria, recurrent infections	Patients who wish to avoid or may not tolerate surgery
Options	<ul style="list-style-type: none"> • Watchful waiting: 50% of patients improve spontaneously • Lifestyle modifications (e.g. evening fluid restriction, planned voiding) 	<ul style="list-style-type: none"> • α-adrenergic antagonists: reduce stromal smooth muscle tone • 5-α reductase inhibitor: block conversion of testosterone to DHT; act to reduce prostate size • Combination is synergistic • Anti-cholinergic agents (for storage LUTS, without elevated PVR) 	<ul style="list-style-type: none"> • TURP (see U42) • Laser ablation • TUIP (prostate <30 g) • Open prostatectomy 	<ul style="list-style-type: none"> • Microwave therapy • TUNA • Prostatic stent (not commonly used)

Men with planned cataract surgery should avoid starting α -adrenergic antagonists until after their surgery due to the risk of intraoperative floppy iris syndrome

BPH Surgery
Absolute Indication

- Renal failure with obstructive uropathy
- Refractory urinary retention

Relative Indications

- Recurrent UTIs
- Recurrent hematuria refractory to medical treatment
- Renal insufficiency (rule out other causes)
- Bladder stones

Finasteride for Benign Prostatic Hyperplasia
Cochrane DB Syst Rev 2010;10:CD006015
Purpose: To examine the effectiveness and safety of finasteride versus placebo or other active controls for the treatment of urinary tract symptoms.

Summary of Findings:

1. Finasteride improved urinary symptoms more than placebo in trials > 1 yr duration and significantly lowered the risk of BPH progression.
2. Compared with α -blockers, finasteride was less effective than either doxazosin or terazosin, but equally as effective as tamsulosin.
3. Symptom improvement with finasteride + doxazosin is equal to doxazosin alone.
4. Finasteride treatment resulted in an increased risk of ejaculation disorder, impotence and lowered libido compared with placebo.
5. Compared with doxazosin and terazosin, finasteride had a lower risk of asthenia, dizziness, and postural hypotension.

Microwave Thermotherapy for Benign Prostatic Hyperplasia

Cochrane DB Syst Rev 2012;9:CD004135
Purpose: To evaluate the efficacy and safety of microwave thermotherapy for the treatment of benign prostatic obstruction.
Selection Criteria: RCTs evaluating transurethral microwave therapy (TUMT) for men with symptomatic BPH with multiple comparison groups.
Results: 15 studies, 1,585 patients, mean age 66.8 yr, 3-60 mo duration. Mean urinary symptom scores decreased by 65% with TUMT and 77% with TURP. The pooled mean peak urinary flow increased by 70% with TUMT and 119% with TURP. Compared with TURP, TUMT was associated with decreased risks for retrograde ejaculation, treatment for strictures, hematuria, blood transfusions and transurethral resection syndrome, but increased risk for dysuria, urinary retention and retreatment for BPH symptoms.

Conclusions: Overall, microwave thermotherapy techniques are effective alternatives to TURP and α -blockers for treating symptomatic BPH, although less effective than TURP in improving symptom score and urinary flow.

Urethral Stricture

Definition

- decrease in urethral calibre due to scar formation in urethra (may also involve corpus spongiosum)
- M>F

Etiology

- congenital
 - failure of normal canalization (i.e. posterior urethral valves)
- trauma
 - instrumentation/catheterization (most common)
 - external trauma (e.g. burns, straddle injury)
 - foreign body
- infection
 - long-term indwelling catheter
 - STI (gonococcal or chlamydial disease)
- inflammation
 - balanitis xerotica obliterans (BXO); lichen sclerosis or chronic progressive sclerosing dermatosis of the male genitalia) causing meatal and urethral stenosis

Clinical Features

- voiding symptoms
- urinary retention
- hydronephrosis
- related infections: recurrent UTI, secondary prostatitis/epididymitis

Investigations

- laboratory findings
 - flow rates <10 mL/s (normal ~20 mL/s) on uroflowmetry
 - urine culture usually negative, but U/A may show pyuria
- radiologic findings
 - RUG and VCUG will demonstrate location
- cystoscopy

Treatment

- urethral dilatation
 - temporarily increases lumen size by breaking up scar tissue
 - healing will often reform scar tissue, recurrence of stricture
- visual internal urethrotomy (VIU)
 - endoscopically incise stricture
 - equal success rates to dilation with mid bulbar strictures <2 cm
 - high rate of recurrence (30-80%), avoid in younger patients
- open surgical reconstruction
 - complete stricture excision with anastomosis, \pm urethroplasty depending on location and size of stricture

Neurogenic Bladder

Definition

- malfunctioning urinary bladder due to deficiency in some aspect of its innervation

Neurophysiology

Table 6. Efferent Sympathetic, Parasympathetic, and Somatic Nerve Supply

Nerve Fibres	Nerve Roots	Neurotransmitter/Receptor	Target
Sympathetic	T10-L2	NA/Adrenergic	Trigone, internal sphincter, proximal urethra (α) Bladder body (β)
Somatic (Pudendal)	S2-4	ACh/Nicotinic	External sphincter
Parasympathetic	S2-4	ACh/Muscarinic (M2, M3)	Detrusor

Nerve roots in micturition:
"S2-3-4 keeps the urine off the floor"

- stretch receptors in the bladder wall relay information to PMC and activate micturition reflex (normally inhibited by cortical input)
 - micturition
 - stimulation of parasympathetic neurons (bladder contraction)
 - inhibition of sympathetic and somatic neurons (internal and external sphincter relaxation, respectively)
 - urine storage
 - opposite of micturition
- voluntary action of external sphincter (pudendal nerve roots S2-S4) can inhibit urge to urinate
- cerebellum, basal ganglia, thalamus, and hypothalamus all have input at PMC in the brainstem

Classification of Neurologic Voiding Dysfunction

- neuropathic detrusor overactivity (formerly termed detrusor hyperreflexia)
 - lesion above PMC (e.g. stroke, tumour, MS, Parkinson's disease)
 - loss of voluntary inhibition of voiding
 - intact pathway inferior to PMC maintains coordination of bladder and sphincter
- detrusor sphincter dyssynergia (DSD)
 - suprasacral lesion of spinal cord (e.g. trauma, MS, arteriovenous malformation, transverse myelitis)
 - loss of coordination between detrusor and sphincter (detrusor contracts on closed sphincter and vice versa)
 - component of detrusor overactivity as well
- detrusor atony/areflexia
 - lesion of sacral cord or peripheral efferents (e.g. trauma, DM, disc herniation, MS, congenital spinal cord abnormality, post abdominoperineal resection)
 - flaccid bladder which fails to contract
 - may progress to poorly compliant bladder with high pressures
- peripheral autonomic neuropathy
 - deficient bladder sensation → increasing residual urine → decompensation (e.g. DM, neurosyphilis, herpes zoster)
- muscular lesion
 - can involve detrusor, smooth/striated sphincter

"Spinal shock", initially manifests as atonic bladder

Neuro-Urologic Evaluation

- Hx and P/E (urologic and general neurologic)
- U/A, renal profile
- imaging
 - IVP (less used), U/S to rule out hydronephrosis and stones
- cystoscopy
- urodynamic studies
 - uroflowmetry to assess flow rate, pattern
 - filling CMG to assess capacity, compliance, detrusor overactivity
 - voiding CMG (pressure-flow study) to assess bladder contractility and extent of bladder outflow obstruction
 - video study to visualize bladder/bladder neck/urethra during CMG using x-ray contrast
 - EMG ascertains presence of coordinated or uncoordinated voiding, allows accurate diagnosis of DSD

Treatment

- goals of treatment
 - prevent renal failure
 - prevent infections
 - achieve social continence

- clean intermittent catheterization (CIC)
- treatment options depend on status of bladder and urethra
 - bladder hyperactivity → anticholinergic medications to relax bladder (see *Urinary Incontinence*, U5)
 - ♦ if refractory
 - botulinum toxin injections into bladder wall
 - occasionally augmentation cystoplasty (enlarging bladder volume and improving compliance by grafting section of detubularized bowel onto the bladder)
 - occasionally urinary diversion (ileal conduit or continent diversion) in severe cases if bladder management unsuccessful
 - flaccid bladder → CIC

Dysuria

Definition

- painful urination

Etiology

Table 7. Differential Diagnosis of Dysuria

Infectious	Cystitis, urethritis, prostatitis, epididymitis/orchitis (if associated with lower tract inflammation), cervicitis, vulvovaginitis, perineal inflammation/infection, TB, vestibulitis
Neoplasm	Kidney, bladder, prostate, penis, vagina/vulva, BPH
Calculi	Bladder stone, urethral stone, ureteral stone
Inflammatory	Seronegative arthropathies (reactive arthritis: arthritis, uveitis, urethritis), drug side effects, autoimmune disorders, chronic pelvic pain syndrome (CPPS), interstitial cystitis
Hormonal	Endometriosis, hypoestrogenism
Trauma	Catheter insertion, post-coital cystitis (honeymoon cystitis)
Psychogenic	Somatization disorder, depression, stress/anxiety disorder
Other	Contact sensitivity, foreign body, radiation/chemical cystitis, diverticulum

Investigations

- focused Hx and P/E to determine cause (fever, d/c, conjunctivitis, CVA tenderness, back/joint pain)
 - any d/c (urethral, vaginal, cervical) should be sent for gonococcus/chlamydia testing; wet mount if vaginal d/c
 - U/A and urine C&S
 - if suspect infection, may start empiric ABx treatment (see *Table 8*, U11)
 - ± imaging of urinary tract (tumour, stones)

Hydronephrosis

Definition

- dilation of the renal pelvis and calyces caused by the impairment in antegrade urine flow

Etiology

- mechanical
 - congenital: see *Congenital Abnormalities*, U35
 - acquired
 - ♦ intrinsic: trauma, inflammation and bleeding, calculi, urologic neoplasms, BPH, urethral stricture, phimosis, previous urological surgery
 - ♦ extrinsic: trauma, neoplasms (uterine fibroid; colorectal, uterine, and cervical malignancies; lymphoma), aortic aneurysm, pregnancy (gravid uterus)
- functional
 - neuropathic: neurogenic bladder, diabetic neuropathy, spinal cord disease
 - pharmacologic: anticholinergics, α-adrenergic agonists
 - hormonal: pregnancy (progesterone decreases ureteral tone)

Investigations

- focused Hx, inquiring about pain (flank, lower abdomen, testes, labia), U/O, medication use, pregnancy, trauma, fever, Hx of UTIs, calculi, and PID and urological surgery

- CBC, electrolytes, Cr, BUN, U/A, C&S
- imaging studies (U/S is >90% sensitive and specific)
 - MAG3 diuretic renogram: evaluates differential renal function and demonstrates if functional obstruction exists

Treatment

- hydronephrosis can be physiologic
- treatment should be guided at improving symptoms, treating infections, or improving renal function
- urgent treatment may require percutaneous nephrostomy tube or ureteral stenting to relieve pressure

Post-Obstructive Diuresis

Definition

- polyuria resulting from relief of severe chronic obstruction
- >3 L/24 h or >200 cc/h over each of two consecutive hours

Pathophysiology

- **physiologic POD** secondary to excretion of retained urea, Na⁺, and H₂O (high osmotic load) after relief of obstruction
 - self-limiting; usually resolves in 48 h with PO fluids but may persist to pathologic POD
- **pathologic POD** is a Na⁺-wasting nephropathy secondary to impaired concentrating ability of the renal tubules due to
 - decreased reabsorption of NaCl in the thick ascending limb and urea in the collecting tubule
 - increased medullary blood flow (solute washout)
 - increased flow and solute concentration in the distal nephrons

Management

- admit patient and closely monitor hemodynamic status and electrolytes (Na⁺ and K⁺ q6-12h and replace prn; follow Cr and BUN to baseline)
- monitor U/O q2h and ensure total fluid intake <U/O by replacing every 1 mL U/O with 0.5 mL 1/2 NS IV (PO fluids if physiologic POD)
- avoid glucose-containing fluid replacement (iatrogenic diuresis)

Overactive Bladder

Definition

- a symptom complex that includes urinary urgency with or without urgency incontinence, urinary frequency (voiding >8 times in a 24 hr period), and nocturia (awakening two or more times at night to void)

Etiology

- etiology unknown
- symptoms usually associated with involuntary contractions of the detrusor muscle. The overactivity of the muscle could be neurogenic, myogenic or idiopathic

Epidemiology

- F:M= 1:1
- prevalence increases with age. 42% in males 75 years old or older; 31% in females 75 years old or older

Diagnosis

- the diagnostic process should document symptoms and signs that define overactive bladder and exclude other disorders that could cause of the patient's symptoms
- minimal requirements for the process consist of
 - focused history including past genitourinary disorders and conditions outlined in Table 8, questionnaires of LUTS for women and diaries of urination frequency, volume and pattern
 - P/E including genitourinary, pelvic and rectal examination
 - urinalysis to rule out hematuria and infection
- in some patients, the following investigations could be considered
 - bladder scan for residual urine in patients with risk factors of urinary retention
 - cystoscopy to rule out recurrent infections, carcinoma in situ and other intravesical abnormalities
 - ♦ urodynamics to rule out obstruction in older men

Treatment

- non-pharmacological: behaviour therapies such as bladder training, bladder control strategies, pelvic floor muscle training, fluid management, and avoidance of caffeine
- pharmacological
 - anti-muscarinics such as oxybutinin hydrochloride, tolterodine, solifenacin, fesoterodine, or trospium
 - β 3-adrenoceptor agonist such as mirabegron
- refractory patients may be treated with
 - neuromuscular-junction inhibition such as botulinum toxin bladder injection
- other interventional procedures include
 - posterior tibial nerve stimulation (not used commonly in Canada)
 - sacral neuromodulation

Table 8. Conditions that could contribute to symptoms of Overactive Bladder

Lower urinary tract conditions	UTI, obstruction, impaired bladder contractility
Neurological conditions	Stroke, MS, dementia, diabetic neuropathy
Systemic diseases	CHF, sleep disorders (primarily nocturia)
Functional and behavioral	Excessive caffeine and alcohol, constipation, impaired mobility
Medication	Diuretics, anticholinergic agents, narcotics, calcium-channel blocker, cholinesterase inhibitors

Infectious and Inflammatory Diseases

Table 8. Antibiotic Treatment of Urological Infections

Condition	Drug	Duration
Urethritis	Non-Gonococcal azithromycin (1 g PO)	x 1
	OR doxycycline (100 mg PO bid)	7 d
	Gonococcal ceftriaxone (250 mg IM) AND treat for <i>Chlamydia trachomatis</i>	x 1
Simple, Uncomplicated UTI	TMP-SMX (160 mg/800 mg PO bid)	3 d
	OR nitrofurantoin (100 mg PO bid)	5 d
Complicated UTI (see <i>Classification</i> , U13 for features)	ciprofloxacin (1 g PO daily OR 400 mg IV q12h)	up to 2-3 wk
	OR ampicillin (1 g IV q6h) + gentamicin (1 mg/kg IV q8h)	up to 2-3 wk
	OR ceftriaxone (1-2 g IV q24h)	up to 2-3 wk
Recurrent/Chronic Cystitis	prophylactic treatment	
	Continuous: TMP-SMX (40 mg/200 mg PO qd OR 3x/wk)	6-12 mo
	OR nitrofurantoin (50-100 mg PO qd)	6-12 mo
	Post-Coital: TMP-SMX (40 mg/200 mg-80 mg/400 mg)	within 2 h of coitus
	OR nitrofurantoin (50-100 mg PO qd)	within 2 h of coitus
Acute Prostatitis	ciprofloxacin (500-750 mg PO bid)	2-4 wk
	OR TMP-SMX (160 mg/800 mg PO bid)	4 wk
	OR IV therapy with gentamicin and ampicillin, penicillin with β -lactamase inhibitor, 3 rd gen cephalosporin, OR a fluoroquinolone	4 wk total (IV and oral step-down)
Chronic Prostatitis	ciprofloxacin (500 mg PO bid)	4-6 wk
Epididymitis/Orchitis	<35 yr ceftriaxone (200 mg IM)	x 1
	AND doxycycline (100 mg PO bid)	10 d
	\geq 35 yr ofloxacin (300 mg PO bid)	10 d
Acute Uncomplicated Pyelonephritis	ciprofloxacin (500 mg PO bid)	7 d
	\pm ceftriaxone (1 g IV) OR ciprofloxacin (400 mg IV)	x 1
	OR IV therapy with a fluoroquinolone, gentamicin and ampicillin, extended spectrum cephalosporin, extended spectrum penicillin, OR a carbapenem	14 d total (IV and oral step-down)

Antibiotic therapy should always be based on local resistance patterns and adjusted according to culture and sensitivity results

Cystitis: Common Pathogens

KEEPS

Klebsiella sp.
E. coli (90%), other Gram-negatives
Enterococci
Proteus mirabilis, *Pseudomonas*
S. saprophyticus

Acute uncomplicated pyelonephritis: suspected or confirmed enterococcus infection requires treatment with ampicillin

Urinary Tract Infection

- for UTIs during pregnancy, see [Obstetrics](#), OB29

Definition

- symptoms suggestive of UTI + evidence of pyuria and bacteriuria on U/A or urine C&S
 - if asymptomatic + 100,000 CFU/mL = asymptomatic bacteriuria; only requires treatment in certain patients (e.g. pregnancy)

Classification

- uncomplicated: lower UTI in a setting of functionally and structurally normal urinary tract
- complicated: structural and/or functional abnormality, male patients, immunocompromised, diabetic, iatrogenic complication, pregnancy, pyelonephritis, catheter-associated
- recurrent: see [Recurrent/Chronic Cystitis](#)

Risk Factors

- stasis and obstruction
 - residual urine due to impaired urine flow e.g. PUVs, reflux, medication, BPH, urethral stricture, cystocele, neurogenic bladder
- foreign body
 - introduce pathogen or act as nidus of infection e.g. catheter, instrumentation
- decreased resistance to organisms
 - DM, malignancy, immunosuppression, spermicide use, estrogen depletion, antimicrobial use
- other factors
 - trauma, anatomic abnormalities, female, sexual activity, fecal incontinence

Clinical Features

- storage symptoms: frequency, urgency, dysuria
- voiding symptoms: hesitancy, post-void dribbling
- other: suprapubic pain, hematuria, foul-smelling urine
- pyelonephritis – if present: typically presents with more severe symptoms (e.g. fever/chills, CVA tenderness, flank pain)

Organisms

- typical organisms
- atypical organisms
 - tuberculosis (TB)
 - *Chlamydia trachomatis*
 - *Mycoplasma (Ureaplasma urealyticum)*
 - fungi (*Candida*)

Indications for Investigations

- pyelonephritis
- persistence of pyuria/symptoms following adequate antibiotic therapy
- severe infection with an increase in Cr
- recurrent/persistent infections
- atypical pathogens (urea splitting organisms)
- Hx of structural abnormalities/decreased flow

Investigations

- U/A, urine C&S
 - UA: leukocytes ± nitrites ± hematuria
 - C&S: midstream, catheterized, or suprapubic aspirate
- if hematuria present, retest post-treatment, if persistent need hematuria workup (see [Microscopic Hematuria](#), U5)
- U/S, CT scan if indicated

Treatment

- see Table 8 for approach to ABx therapy
- if febrile, consider admission with IV therapy and rule out obstruction

Prevention of UTIs

- Maintain good hydration (try cranberry juice)
- Wipe from front to back to avoid contamination of the urethra with feces from the rectum
- Avoid feminine hygiene sprays and scented douches
- Empty bladder immediately before and after intercourse

Recurrent/Chronic Cystitis

Definition

- ≥ 3 UTIs/yr

Etiology

- bacterial reinfection (80%) vs. bacterial persistence (relapse)
 - **bacterial reinfection**
 - ♦ recurrence of infection with either 1) a different organism, 2) the same organism if cultured >2 wk following therapy, or 3) with any organism with an intermittent sterile culture
 - **bacterial persistence**
 - ♦ same organism cultured within 2 wk of sensitivity-based therapy

Investigations

- assess predisposing factors as described above
- investigations may include cystoscopy, U/S, CT

Treatment

- lifestyle changes (limit caffeine intake, increase fluid/H₂O intake)
- ABx: continuous vs. post-coital
- post-menopausal women: consider topical or systemic estrogen therapy
- no treatment for asymptomatic bacteriuria except in pregnant women or patients undergoing urinary tract instrumentation

Interstitial Cystitis (Painful Bladder or Bladder Pain Syndrome)

Definition

- bladder pain, chronic urgency and frequency without other reasonable causation

Classification

- non-ulcerative (more common)
- ulcerative

Etiology

- unknown
 - theories: increased epithelial permeability, autoimmune, neurogenic, defective GAG layer overlying mucosa
 - associations: severe allergies, IBS, fibromyalgia

Epidemiology

- prevalence: 20/100,000
- 90% of cases are in females
- mean age at onset is 40 yr (non-ulcerative tends to affect a younger to middle-aged population, while ulcerative tends to be seen in middle-aged to older)

Clinical Features

- pain associated with the bladder
- glomerulations (submucosal petechiae) or Hunner's lesions (ulcers) on cystoscopic examination
- urinary urgency
- negative U/A, urine C&S, and urine cytology

Differential Diagnosis

- UTI, vaginitis, bladder tumour
- radiation/chemical cystitis
- eosinophilic/TB cystitis
- bladder calculi

Treatment

- first-line: patient empowerment (diet, lifestyle, stress management), pain management
- second-line
 - oral: pentosan polysulfate sodium, amitriptyline, cimetidine, hydroxyzine
 - intravesical: dimethylsulfoxide (DMSO), heparin, lidocaine
- third-line: cystoscopy with bladder hydrodistention (traditionally diagnostic) under GA, treat Hunner's lesions if present
- other: neuromodulation, cyclosporine A, intradetrusor botulinum toxin
- surgery (last resort): augmentation cystoplasty, or urinary diversion \pm cystectomy

Cystoscopic evaluation is not necessary to make a diagnosis

Four Symptom Scores Exist to Evaluate and Monitor Patients with Interstitial Cystitis

- Interstitial Cystitis Symptom Index (ICSI)
- Interstitial Cystitis Problem Index (ICPI)
- Wisconsin Interstitial Cystitis (UW-IC) Scale
- Pain, Urgency and Frequency (PUF) Score

Acute Pyelonephritis

Definition

- infection of the renal parenchyma with local and systemic manifestations
- clinical diagnosis of flank pain, fever and elevated WBC

Etiology

- ascending (usually GN bacilli) or hematogenous route (usually GP cocci)
- causative microorganisms
 - gram positives: *Enterococcus faecalis*, *S. aureus*, *S. saprophyticus*
 - gram negatives: *E. coli* (most common), *Klebsiella*, *Proteus*, *Pseudomonas*, *Enterobacter*
- common underlying causes of pyelonephritis
 - stones, strictures, prostatic obstruction, vesicoureteric reflux, neurogenic bladder, catheters, DM, sickle-cell disease, PCKD, immunosuppression, post-renal transplant, instrumentation, pregnancy

Clinical Features

- rapid onset (<24 h)
- LUTS including frequency, urgency, hematuria; NOT dysuria unless concurrent cystitis
- fever, chills, nausea, vomiting, myalgia, malaise
- CVA tenderness or exquisite flank pain

Investigations

- U/A, urine C&S
- CBC and differential: leukocytosis, left shift
- imaging indicated if suspicious of complicated pyelonephritis or symptoms do not improve with 48-72 h of treatment
 - abdominal/pelvic U/S
 - CT
- nuclear medicine: DMSA scan can be used to help secure the diagnosis
 - a photopenic defect indicates active infection or scar; if normal alternative diagnoses should be considered

Treatment

- hemodynamically stable
 - outpatient oral ABx treatment ± single initial IV dose (see Table 9)
- severe or non-resolving
 - admit, hydrate, and treat with IV ABx (see Table 9)
- emphysematous pyelonephritis
 - percutaneous nephrostomy tube and antibiotics first line
 - consider early nephrectomy after IV ABx started and patient stabilized
- renal obstruction
 - admit for emergent stenting or percutaneous nephrostomy tube

Nitrofurantoin has poor tissue penetration and therefore is not used to treat pyelonephritis (requires post-renal uroconcentration)

Prostatitis/Prostatodynia

Epidemiology

- most common urologic diagnosis in men <50 yr
- prevalence 2-12%

Classification

Table 10. Comparison of the Three Types of Prostatitis

	Category I: Acute Bacterial Prostatitis	Category II: Chronic Bacterial Prostatitis	Category III: Chronic Pelvic Pain Syndrome (CPPS) (Abacterial)
Etiology	Ascending urethral infection with KEEPS (see U12 sidebar): 80% <i>E. coli</i> Often associated with outlet obstruction, recent cystoscopy, prostatic biopsy Most infections occur in the peripheral zone (see Figure 7, U7)	Recurrent exacerbations of acute prostatitis-like signs and symptoms Recurrent UTI with same organism	Divided into inflammatory (IIIA) and non-inflammatory (IIIB) Intraprostatic reflux of urine ± urethral hypertonia Multifactorial (immunological, neuropathic, neuroendocrine, psychosocial)
Clinical Features	Acute onset fever, chills, malaise Rectal, lower back, and perineal pain LUTS	Pelvic pain, storage LUTS, ejaculatory pain, post-ejaculatory pain	Pelvic pain, storage LUTS, ejaculatory pain, post-ejaculatory pain
Investigations	P/E: abdomen, external genitalia, perineum, prostate U/A Blood CBC, C&S Transrectal U/S if non-resolving/suspect prostatic abscess	P/E: as per Category I + pelvic floor Urine C&S: 4-glass test VB1 (voided bladder): initial (urethra) VB2: midstream (bladder) EPS (expressed prostatic secretions): not usually performed VB3: post-massage/DRE	Same as per Category II NIH-CPSI score* Consider psychological assessment
Treatment	Supportive measures PO or IV ABx depending how sick (see Table 9) May consider catheterization in patients with severe obstructive LUTS or retention I&D of abscess if present	ABx (see Table 9) Consider addition of an α -blocker	Supportive measures Trial of ABx therapy if newly diagnosed Multimodal treatment strategy may include: α -blocker Anti-inflammatories Phytotherapy (quercetin, cernilton)

*NIH-CPSI: National Institute of Health Chronic Prostatitis Symptom Index

4-Glass Test: Prostatic source is suggested when colony counts in EPS and VB3 exceed those of VB1 and VB2 by 10x

It is not recommended to do a serum PSA during acute bacterial prostatitis

Prostatic massage may cause extreme tenderness and increased risk of inducing sepsis, abscess, or epididymo-orchitis

Epididymitis and Orchitis

Etiology

- common infectious causes
 - <35 yr: *N. gonorrhoeae* or *Chlamydia trachomatis*
 - ≥35 yr or penetrative anal intercourse: GI organisms (especially *E. coli*)
- other causes
 - mumps infection may involve orchitis, post-parotitis
 - TB
 - syphilis
 - granulomatous (autoimmune) in elderly men
 - amiodarone (involves only head of epididymis)
 - chemical: reflux of urine into ejaculatory ducts

Risk Factors

- UTI
- unprotected sexual contact
- instrumentation/catheterization
- increased pressure in prostatic urethra (straining, voiding, heavy lifting) may cause reflux of urine along vas deferens → sterile epididymitis
- immunocompromise

Clinical Features

- sudden onset scrotal pain and swelling ± radiation along cord to flank
- scrotal erythema and tenderness
- fever
- storage symptoms, purulent d/c
- reactive hydrocele

Investigations

- U/A, urine C&S
- ± urethral d/c: Gram stain/culture
- if diagnosis uncertain, must do
 - colour-flow Doppler U/S to rule out testicular torsion

Treatment

- rule out torsion (see *Investigations* Table 24, U29)
- see Table 9 for ABx therapy
- scrotal support, bed rest, ice, analgesia

Prehn's Sign: pain may be relieved with elevation of testicles in epididymitis but not in testicular torsion (poor sensitivity, especially in children)

If unsure between diagnoses of epididymitis and torsion, always go to OR

Remember: torsion >6 h has poor prognosis

Complications

- if severe → testicular atrophy
- 30% have persistent infertility problems

Urethritis

Etiology

- infectious or inflammatory (e.g. reactive arthritis)

Table 11. Infectious Urethritis: Gonococcal vs. Non-Gonococcal

	Gonococcal	Non-Gonococcal
Causative Organism	<i>Neisseria gonorrhoeae</i>	Usually <i>Chlamydia trachomatis</i>
Diagnosis	Hx of sexual contact, thick, profuse, yellow-grey purulent d/c, LUTS Gram stain (GN diplococci), urine PCR and/or culture from urethral specimen	Hx of sexual contact, mucoid whitish purulent d/c, ± storage LUTS Gram stain demonstrates >4 PMN/oil immersion field, no evidence of <i>N. gonorrhoeae</i> , urine PCR and/or culture from urethral specimen
Treatment	See Table 9	See Table 9

Inadequately treated acute epididymitis may lead to chronic epididymitis or epididymo-orchitis

Reactive Arthritis (formerly known as Reiter's syndrome)
Urethritis, uveitis (or conjunctivitis), and arthritis (can't pee, can't see, can't climb a tree)

If culture negative or unresponsive to treatment consider: *Ureaplasma urealyticum*, *Mycoplasma genitalium*, *Trichomonas vaginalis*, HSV, or adenovirus

Stone Disease

Epidemiology

- prevalence of 2-3%
- M:F = 3:1
- peak incidence 30-50 yr of age
- recurrence rate: 10% at 1 yr, 50% at 5 yr, 60-80% lifetime

Risk Factors

- hereditary: RTA, Glucose-6-phosphate dehydrogenase deficiency, cystinuria, xanthinuria, oxaluria, etc.
- lifestyle: minimal fluid intake; excess vitamin C, oxalate, purines, calcium
- medications: loop diuretics (furosemide, bumetanide), acetazolamide, topiramate, and zonisamide
- medical conditions: UTI (with urea-splitting organisms: *Proteus*, *Pseudomonas*, *Providencia*, *Klebsiella*, *Mycoplasma*, *Serratia*, *S. aureus*), myeloproliferative disorders, IBD, gout, DM, hypercalcemia disorders (hyperparathyroidism, tumour lysis syndrome, sarcoidosis, histoplasmosis), obesity (BMI >30)

Clinical Features

- urinary obstruction → upstream distention → pain
 - flank pain from renal capsular distention (non-colic)
 - severe waxing and waning pain radiating from flank to groin, testis, or tip of penis due to stretching of collecting system or ureter (ureteral colic)
- writhing, never comfortable, nausea, vomiting, hematuria (90% microscopic), diaphoresis, tachycardia, tachypnea
- occasionally symptoms of trigonal irritation (frequency, urgency)
- bladder stones result in: storage and voiding LUTS, terminal hematuria, suprapubic pain
- if fever, rule out concurrent pyelonephritis and/or obstruction

Table 12. Differential Diagnosis of Renal Colic

GU	Abdominal	Neurological
<ul style="list-style-type: none"> • Pyelonephritis • Ureteral obstruction from other cause: UPJ obstruction, clot colic secondary to gross hematuria, sloughed papillae • Gynecological: ectopic pregnancy, torsion/rupture of ovarian cyst, PID 	<ul style="list-style-type: none"> • AAA • Bowel ischemia • Pancreatitis • Other acute abdominal crisis 	<ul style="list-style-type: none"> • Radiculitis (L1): herpes zoster, nerve root compression

Location of Stones

- calyx: may cause flank discomfort, persistent infection, persistent hematuria, or remain asymptomatic
- pelvis: tend to cause obstruction at UPJ, may cause persistent infection
- ureter: <5 mm diameter will pass spontaneously in 75% of patients

Stone Pathogenesis

- supersaturation of stone constituents (at appropriate temperature and pH)
- stasis, low flow, and low volume of urine (dehydration)
- crystal formation and stone nidus
- loss of inhibitory factors
 - citrate (forms soluble complex with calcium)
 - magnesium (forms soluble complex with oxalate)
 - pyrophosphate
 - Tamm-Horsfall glycoprotein

Key Points in Stone Hx

- Diet (especially FLUID INTAKE)
- Predisposing medical conditions
- Predisposing medications
- Previous episodes/investigations/treatments
- Family Hx (1st degree relative)

The four narrowest passage points for upper tract stones are:

- UPJ
- Pelvic brim
- Under vas deferens/broad ligament
- UVJ

	Radiopaque	Radiolucent
KUB	Calcium Struvite Cystine	Uric acid Indinavir Atazanavir
CT	Calcium Struvite Cystine Uric acid	Indinavir Atazanavir

Approach to Renal Stones

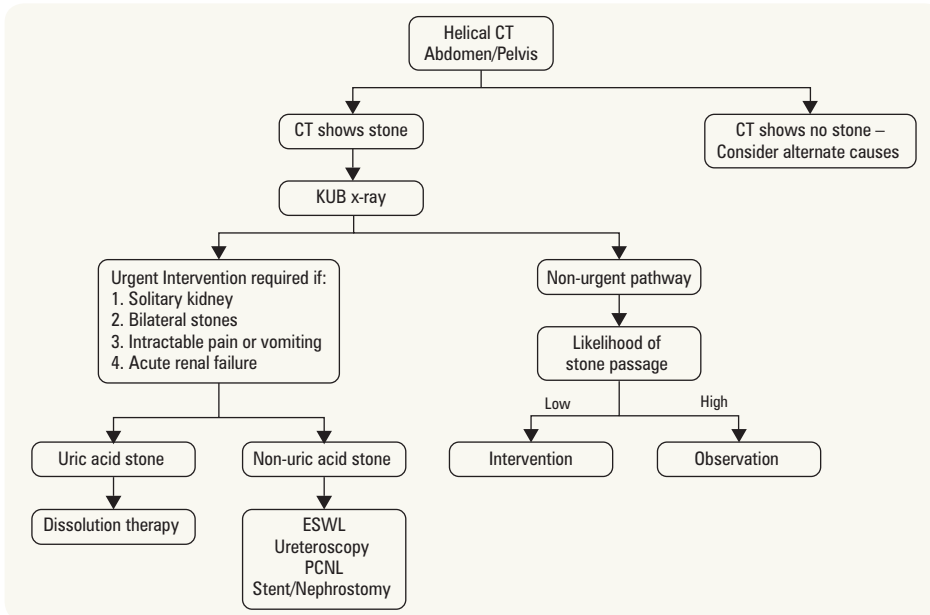

Figure 8. Approach to renal stone

Investigations

Table 13. Investigations for Renal Stones

	CBC, Uric Acid, U/A, Urine C&S	KUB x-ray	CT Scan	Abdominal Ultrasound	Cystoscopy	PTH, 24 h urine x 2 for volume, Cr, Ca ²⁺ , Na ⁺ , PO ₄ ³⁻ , Mg ²⁺ , oxalate, citrate, ± cystine
Who gets it?	Everyone	Most	First episode renal colic	Pediatric cases or those concerning for obstruction	± Those concerning for bladder stone	Recurrent Ca ²⁺ stone formers ± pediatric cases
Why is it done?	May show signs of infection, ± sensitivities	90% of stones are radiopaque Good for follow-up	Distinguish radiolucent stone from soft tissue filling defect X-ray comparison	Identify and follow-up stone without radiation exposure Visualize hydronephrosis	Visualize bladder	Need to rule out metabolic cause for stones
Cautions	–	Do not mistake phleboliths for stones!	Radiation (especially if female of child bearing age) Must be a non-contrast scan	Not good at visualizing stones in ureter	–	–

Treatment – Acute

- medical
 - analgesic ± antiemetic
 - NSAIDs help lower intra-ureteral pressure
 - medical expulsion therapy (MET)
 - ♦ α-blockers: increase rate of spontaneous passage in distal ureteral stones
 - ♦ calcium channel blockers
 - ± Abx for bacteriuria
 - IV fluids if vomiting (note: IV fluids do NOT promote stone passage)
- interventional
 - required if obstruction endangers patient, e.g. sepsis, renal failure
 - first line: ureteric stent (via cystoscopy)
 - second line: image-guided percutaneous nephrostomy
- admit if necessary
 - *Indications for Admission to Hospital*

Treatment – Elective

- medical
 - likely conservative if ureteral stone <10 mm or kidney stone <5 mm and no complications/symptoms well controlled
 - ♦ stones <5 mm especially likely to pass spontaneously
 - PO fluids to increase urine volume to >2 L/d (3-4 L if cystine) and MET
 - specific to stone type (see Table 14)
 - periodic imaging to monitor stone position and assess for hydronephrosis
 - progress to interventional stone removal methods if symptoms worsen or fail to improve (indicating stone passage)

Although hypercalciuria is a risk factor for stone formation, decreasing dietary calcium is NOT recommended to prevent stone formation. Low dietary calcium leads to increased GI oxalate absorption and higher urine levels of calcium oxalate

Stones and Infection

If septic, urgent decompression via ureteric stent or percutaneous nephrostomy is indicated. Definitive treatment of the stone should be delayed until the sepsis has cleared

Indications for PCNL

- Size >2 cm
- Staghorn
- UPJ obstruction
- Calyceal diverticulum
- Cystine stones (poorly fragmented with ESWL)
- Anatomical abnormalities
- Failure of less invasive modalities

24 h urine collections must be done AFTER discontinuing stone preventing/promoting medications

Indications for Admission to Hospital

- Intractable pain
- Intractable vomiting
- Fever (suggests infection)
- Compromised renal function (including single kidney, bilateral obstructing stone)
- Pregnancy

Detailed metabolic studies are NOT recommended unless complex patient (recurrent stone formers, pregnancy, pediatrics, strong family Hx, underlying kidney or systemic disease, etc.)

- interventional
 - kidney
 - ♦ may stent prior to ESWL if stone is 1.5-2.5 cm
 - ♦ ESWL if stone <2 cm
 - ♦ PCNL if stone >2 cm
 - ureteral stones >10 mm
 - ♦ ESWL and URS are both first line treatment modalities for all locations
 - URS has significantly greater stone-free rates for stones at all locations in ureter, but also has higher complication rates (ureter perforation, stricture formation, etc.)
 - ♦ PCNL is second line treatment
 - ♦ laparoscopic or open stone removal (very rare)
 - bladder
 - ♦ transurethral stone removal or cystolitholapaxy
 - ♦ remove outflow obstruction (TURP or stricture dilatation)

Prevention

- dietary modification
 - increase fluid (>2 L/d), K⁺ intake
 - reduce animal protein, oxalate, Na⁺, sucrose, and fructose intake
 - avoid high-dose vitamin C supplements
- medications
 - thiazide diuretics for hypercalciuria
 - allopurinol for hyperuricosuria
 - potassium citrate for hypocitraturia, hyperuricosuria

Alpha-blockers as Medical Expulsive Therapy for Ureteral Stones

Cochrane DB Syst Rev 2014;4:CD008509

Purpose: To determine whether or not alpha blockers compared with other pharmacological treatments or placebo improve stone clearance rates and other clinically relevant outcomes in patients presenting with symptoms of stones less than 10mm confirmed by imaging.

Results/Conclusions: 32 RCTs, 5,864 participants. Although patients using alpha-blockers were more likely to experience adverse effects compared to standard therapy, stone-free rates were significantly higher in the alpha-blocker group (RR 1.48, 95% CI 1.33-1.64), expulsion time was 2.91 days shorter, and there was a reduction in the number of pain episodes (MD -0.48, 95% CI -0.94 to -0.01), the need for analgesic medication (MD -38.17, 95% CI -74.93 to -1.41), and hospitalization (RR 0.35, 95% CI 0.13-0.97). Alpha blockers should therefore be offered as a primary treatment modality for ureteral stones.

Consideration must be given to monitoring stone formers with periodic imaging (i.e. at year 1 and then q2-4yr based on likelihood of recurrence)

Table 14. Stone Classification

Type of Stone	Calcium (75-85%)	Uric Acid (5-10%)	Struvite (5-10%)	Cystine (1%)
Etiology	Hypercalciuria Hyperuricosuria (25% of patients with Ca ²⁺ stones) Hyperoxaluria (<5% of patients) Hypocitraturia (12% of patients) Other causes: • Hypomagnesemia – associated with hyperoxaluria and hypocitraturia • High dietary Na ⁺ • Decreased urinary proteins • High urinary pH, low urine volume (e.g. GI water loss) • Hyperparathyroidism, obesity, gout, DM	Uric acid precipitates in low volume, acidic urine with a high uric acid concentration: • Hyperuricosuria alone • Low urinary pH, low urine volume (e.g. GI water loss) • Drugs (ASA, thiazides) • Diet (purine rich red meats) • Hyperuricosuria with hyperuricemia • Gout • High rate of cell turnover or cell death (leukemia, cytotoxic drugs)	Infection with urea-splitting organisms (<i>Proteus</i> , <i>Pseudomonas</i> , <i>Providencia</i> , <i>Klebsiella</i> , <i>Mycoplasma</i> , <i>Serratia</i> , <i>S. aureus</i>) results in alkaline urinary pH and precipitation of struvite (magnesium ammonium phosphate)	Autosomal recessive defect in small bowel mucosal absorption and renal tubular absorption of dibasic amino acids results in “COLA” in urine (cystine, ornithine, lysine, arginine)
Key Features	Radiopaque on KUB Reducing dietary Ca ²⁺ is NOT an effective method of prevention/treatment	Radiolucent on KUB Radiopaque on CT Acidic urine, pH <5.5 (NOT necessarily elevated urinary uric acid)	Perpetuates UTI because stone itself harbours organism Stone and all foreign bodies must be cleared to avoid recurrence Associated with staghorn calculi Positive urine dip and cultures Note: <i>E. coli</i> infection does not cause struvite stones M:F = 3:1, UTI more common in female	Aggressive stone disease seen in children and young adults Recurrent stone formation, family Hx Often staghorn calculi Faintly radiopaque on KUB Positive urine sodium nitroprusside test, urine chromatography for cystine
Treatment Medical if stone <5 mm and no complications Procedural/Surgical treatment if stone >5 mm or presence of complications (see U17 for treatment)	Fluids to increase urine volume to >2 L/d For calcium stones: cellulose phosphate, orthophosphate for absorptive causes Calcium oxalate: thiazides, ± potassium citrate, ± allopurinol Calcium struvite: ABx (stone must be removed to treat infection)	Increased fluid intake Alkalinization of urine to pH 6.5 to 7 (bicarbonate, potassium citrate) ± allopurinol	Complete stone clearance ABx for 6 wk Regular follow-up urine cultures	Increased fluid intake (3-4 L of urine/d) Alkalinize urine (bicarbonate, potassium citrate), Penicillamine/α-MPG or Captopril (form complex with cystine) ESWL not effective

Urological Neoplasms

Approach to Renal Mass

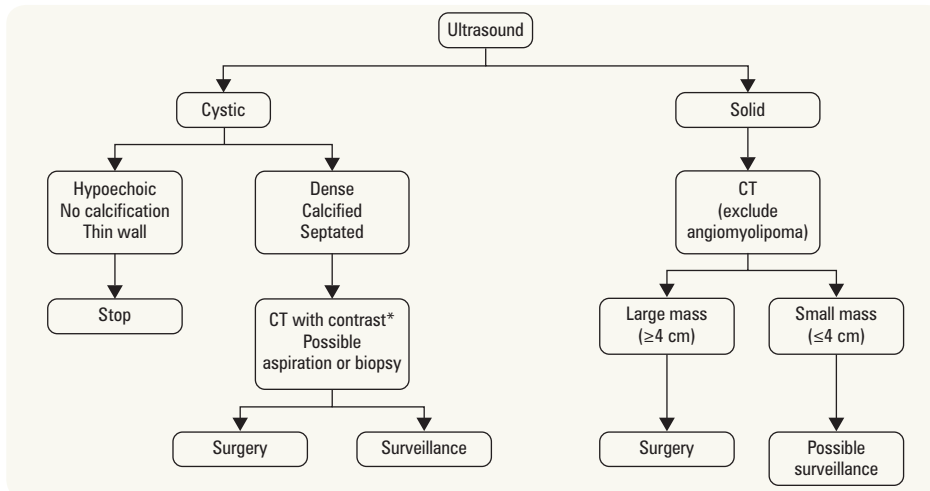

Figure 9. Workup of a renal mass

*Imaging modality may be different in cases of contrast allergy or elevated creatinine

There is controversy over optimal management of small renal masses

Benign Renal Neoplasms

CYSTIC KIDNEY DISEASE

- **simple cysts:** usually solitary or unilateral
 - very common: up to 50% at age 50
 - usually incidental finding on abdominal imaging
 - **Bosniak Classification** is used to stratify for risk of malignancy based on cyst features from contrast CT
- **polycystic kidney disease**
 - autosomal recessive: multiple bilateral cysts, often leading to early renal failure in infants
 - autosomal dominant: progressive bilateral disease leading to HTN and renal failure, adult-onset
- **medullary sponge kidney:** cystic dilatation of the collecting ducts
 - usually benign course, but patients are predisposed to stone disease
- **von Hippel-Lindau syndrome:** multiple bilateral cysts or clear cell carcinomas (50% incidence of RCC)
 - renal cysts, cerebellar, spinal and retinal hemangioblastomas, pancreatic and epididymal cysts, pheochromocytomas

Table 15. Bosniak Classification of Renal Cysts

Class	Description	Features	Risk of Malignancy	Management Plan
I	Simple cyst	Round, no septations, no calcifications, no solid component	Near zero	Follow-up usually not required
II	Simple cyst	A few thin septa, no true enhancement, well-margined, uniform high attenuation, <3 cm	Minimal	Follow-up usually not required
IIF	Minimally complex cyst with extra features that require follow-up	Still well-margined and non-enhancing, but now multiple thin septa or some thickening/calcification of septa/wall, >3 cm	5-20%	Requires follow-up with imaging q6-12mo If the lesion evolves, may require surgical resection
III	Complex cyst	Thicker or more irregular walls with measurable enhancement	>50%	Requires surgical resection
IV	Clearly malignant	Class III + enhancing soft-tissue components	>90%	Requires surgical resection

Table 16. Benign Renal Masses

	Angiomyolipoma (Renal Hamartoma)	Renal Oncocytoma	Renal Adenoma
Epidemiology	<1% of adult renal tumours F>M 20% associated with tuberous sclerosis (especially if multiple, recurrent)	3-7% of renal tumours M>F Oncocytomas also found in adrenal, thyroid and parathyroid glands	Most common benign renal neoplasm M:F = 3:1 Incidence increases with age Found in 7-23% of all autopsies
Characteristics	Clonal neoplasm consisting of blood vessels (angio-), smooth muscle (-myo-), and fat (-lipoma) May extend into regional lymphatics and other organs and become symptomatic	Spherical, capsulated with possible central scar Histologically organized aggregates of eosinophilic cells originating from intercalated cells of collecting duct	Small cortical lesions <1 cm Majority are solitary but can be multifocal
Diagnosis	Incidental finding on CT Negative attenuation (-20 HU) on CT is pathognomonic Rare presentation of hematuria, flank pain, and palpable mass (same as RCC)	Incidental finding on CT Difficult to distinguish from RCC on imaging – treated as RCC until proven otherwise Biopsy may be performed to rule out malignancy	Incidental finding on CT Rarely symptomatic Controversy as to whether this represents benign or pre-malignant neoplasm
Management	May consider surgical excision or embolization if symptomatic (pain, bleeding) or higher risk of bleeding (e.g. pregnancy) Potential role for mTOR inhibitors in unresectable/metastatic disease Follow with serial U/S	Partial/radical nephrectomy for large masses HIFU or RFA for smaller masses	If mass >3 cm, likely not a benign adenoma; will require partial/radical nephrectomy due to increased likelihood of malignancy

Malignant Renal Neoplasms

RENAL CELL CARCINOMA

Etiology

- cause unknown
- originates from proximal convoluted tubule epithelial cells in clear cell subtype (most common)
- hereditary forms seen with von Hippel-Lindau syndrome and hereditary papillary renal carcinoma

Epidemiology

- 8th most common malignancy (accounts for 3% of all newly diagnosed cancers)
- 85% of primary malignant tumours in kidney
- M:F = 3:2
- peak incidence at 50-60 yr of age

Pathology

- histological subtypes: clear cell (75-85%), papillary (10-15%), chromophobic (5-10%), collecting duct
- sarcomatoid elements in any subtype is a poor prognostic factor

Risk Factors

- top 3 risk factors: smoking, HTN, obesity
- miscellaneous: horseshoe kidney, acquired renal cystic disease
- role of environmental exposures (aromatic hydrocarbons, etc.) remains an unproven risk factor for development of RCC

Clinical Features

- usually asymptomatic: frequently diagnosed incidentally by U/S or CT
- poor prognostic indicators: weight loss, weakness, anemia, bone pain
- classic “too late triad” found in 10-15%
 - gross hematuria 50%
 - flank pain <50%
 - palpable mass <30%
- was called the “internist’s tumour” because of paraneoplastic symptomatology – now called the “radiologist’s tumour” because of incidental diagnosis via imaging
- metastases: seen in 1/3rd of new cases; additional 20-40% will go on to develop metastases
 - bone, brain, lung and liver most common site
 - may invade renal veins and inferior vena cava lumen. This may result in ascites, hepatic dysfunction, right atrial tumour, and pulmonary emboli

Investigations

- routine labs for paraneoplastic syndromes (CBC, ESR, LFTs, extended electrolytes)
- U/A (60-75% have hematuria)
- renal U/S: solid vs. cystic lesion

Figure 10. RCC staging

Role of environmental exposures (aromatic hydrocarbons, etc.) remains an unproven risk factor for development of RCC

RCC Systemic Effects: paraneoplastic syndromes (10-40% of patients)

- Hematopoietic disturbances: anemia, polycythemia, raised ESR
- Endocrinopathies: hypercalcemia (increased vitamin D hydroxylation), erythrocytosis (increased erythropoietin), HTN (increased renin), production of other hormones (prolactin, gonadotropins, TSH, insulin, and cortisol)
- Hepatic cell dysfunction or Stauffer syndrome: abnormal LFTs, decreased WBC count, fever, areas of hepatic necrosis; no evidence of metastases; reversible following removal of primary tumour
- Hemodynamic alterations: systolic HTN (due to AV shunting), peripheral edema (due to caval obstruction)

- contrast-enhanced CT: higher sensitivity than U/S for detection of renal masses and for staging purposes
- MRI: useful for evaluation of vascular extension
- renal biopsy: to confirm diagnosis if considering observation or other non-surgical therapy

Staging

- involves CT, CXR, liver enzymes and LFTs, bone/head imaging (if symptoms dictate)

Table 17. 2010 TNM Classification of Renal Cell Carcinoma

T	N	M
T1: tumour <7 cm, confined to renal parenchyma T1a: <4 cm T1b: 4-7 cm	N0: no regional nodes	M0: no evidence of metastasis
T2: tumour >7 cm, confined to renal parenchyma T2a: tumour >7 cm but ≤10 cm in greatest dimension, limited to the kidney T2b: tumour >10 cm, limited to the kidney	N1: metastasis to a single node, <2 cm	M1: presence of distant metastasis
T3: tumour extends into major veins or perinephric tissues, but NOT into ipsilateral adrenal or beyond Gerota's fascia T3a: into renal vein or sinus fat T3b: into infradiaphragmatic IVC T3c: into supradiaphragmatic IVC	N2: metastasis to a single node between 2-5 cm or multiple nodes <2 cm	
T4: tumour extends beyond Gerota's fascia including extension into ipsilateral adrenal	N3: node >5 cm	

Tumour may invade renal veins and inferior vena cava lumen. This may result in ascites, hepatic dysfunction, right atrial tumour, and pulmonary emboli

Treatment

- surgical
 - radical nephrectomy: en bloc removal of kidney, tumour, ipsilateral adrenal gland (in upper pole tumours) and intact Gerota's capsule and paraaortic lymphadenectomy
 - partial nephrectomy (parenchyma-sparing): small tumour (roughly <4 cm) or solitary kidney/bilateral tumours
 - surgical removal of solitary metastasis may be considered
- ablative techniques (cryoablation, RFA)
- palliative radiation to painful bony lesions
- therapy for advanced stage
 - tyrosine kinase inhibitors for metastatic disease (e.g. sunitinib, sorafenib)
 - anti-angiogenesis/anti-VEGF (e.g. bevacizumab)
 - mTOR inhibitors (e.g. temsirolimus, everolimus)
 - high-dose IL-2 (high toxicity but able to induce long-term cure in 5-7% of patients)
 - IFN α: monotherapy has been largely replaced by molecularly targeted agents listed above

Prognosis

- stage at diagnosis most important prognostic factor
 - T1: 90-100% 5 yr survival
 - T2-T3: 60% 5 yr survival
 - metastatic disease: <5% 10 yr survival

Sorafenib in Advanced Clear-Cell Renal Cell Carcinoma – TARGET Trial

NEJM 2007;356:125-134

Study: Phase III, double-blind RCT comparing multikinase inhibitor, sorafenib, with placebo in treatment of advanced clear-cell renal cell carcinoma.

Methods: Patients with clear cell renal cell carcinoma, resistant to standard therapy. The main intervention and outcome were sorafenib and overall survival, respectively.

Results: Progression-free survival in intervention group was 5.5 mo, compared with 2.8 mo in the placebo group. The survival improvement was associated with an increased number of adverse events.

Axitinib vs. Sorafenib as Second-Line Treatment for Advanced Renal Cell Carcinoma: Overall Survival Analysis and Updated Results from a Randomized Phase 3 Trial

Lancet Oncol 2013;14:552-562

Study: Phase 3 trial of patients with clear cell metastatic renal cell carcinoma randomized to receive axitinib 5 mg twice daily (n=361) or sorafenib 400 mg twice daily (n=362).

Results: Median overall survival was 20.1 mo with axitinib (16.7-23.4) and 19.2 mo with sorafenib (17.5-22.3) (HR 0.969, 95% CI 0.800-1.174). Median progression-free survival was 8.3 months with axitinib (6.7-9.2) and 5.7 mo with sorafenib (4.7-6.5) (HR 0.656, 95% CI 0.552-0.779).

Conclusions: Axitinib should be a second-line treatment option for patients with metastatic renal cell carcinoma.

Radiotherapy With or Without Chemotherapy in Muscle-Invasive Bladder Cancer

NEJM 2012;366:1477-1488

Study: Phase 3 trial with random assignment of 360 patients with muscle-invasive bladder cancer to radiotherapy with or without chemotherapy.

Results: At 2 yr, rates of locoregional disease-free survival were 67% in the chemoradiotherapy group and 54% in the radiotherapy group (HR 0.68, 95% CI 0.48-0.96). Five year overall survival rates were 48% in the chemoradiotherapy group and 35% in the radiotherapy group (HR 0.82, 95% CI 0.63-1.09).

Conclusions: Chemotherapy with fluorouracil and mitomycin C in combination with radiotherapy improves locoregional control of bladder cancer compared to radiotherapy alone, with no significant increase in adverse events.

Carcinoma of the Renal Pelvis and Ureter

Etiology

- risk factors include
 - smoking
 - chemicals/dietary exposures (industrial dyes and solvents; aristolochic acid)
 - analgesic abuse (acetaminophen, ASA, and phenacetin)
 - Balkan nephropathy

Epidemiology

- rare: accounts for 5% of all urothelial cancers
- frequently multifocal, 2-5% are bilateral
- M:F = 3:1
- relative incidence: bladder:renal:ureter = 100:10:1

Pathology

- 85% are papillary urothelial cell carcinoma; others include SCC and adenocarcinoma
- UCC of ureter and renal pelvis are histologically similar to bladder UCC

Clinical Features

- gross/microscopic hematuria
- flank pain
- storage or voiding symptoms (dysuria only if lower urinary tract involved)
- flank mass ± hydronephrosis (10-20%)

Investigations

- IVP/CT urogram
- cystoscopy and retrograde pyelogram

Treatment

- radical nephroureterectomy with cuff of bladder
- distal ureterectomy for distal ureteral tumours
- emerging role for endoscopic laser ablation in patients with low grade disease, poor baseline renal health

Differential Diagnosis of Filling Defect

- Urothelial carcinoma (differentiate via cytology and CT scan)
- Uric acid stone (differentiate via cytology and CT scan)
- Blood clot
- Pyelitis cystica
- Papillary necrosis
- Fungus ball
- Gas bubble from gas producing organisms

Bladder Carcinoma

Etiology

- unknown, but environmental risk factors include
 - smoking (main factor – implicated in 60% of new cases)
 - aromatic amines: naphthylamines, benzidine, tryptophan, phenacetin metabolites
 - cyclophosphamide
 - prior Hx of radiation treatment to the pelvis
 - *Schistosoma hematobium* infection (associated with SCC)
 - chronic irritation: cystitis, chronic catheterization, bladder stones (associated with SCC)
 - aristolochic acid: associated with Balkan Nephropathy (renal failure, upper tract urothelial cancer) and Chinese Herbal Nephropathy

Epidemiology

- 2nd most common urological malignancy
- M:F = 3:1, more common among whites than blacks
- mean age at diagnosis is 65 yr

Pathology

- classification
 - UCC >90%
 - SCC 5-7%
 - adenocarcinoma 1%
 - others <1%
- stages and prognoses of urothelial carcinoma at diagnosis
 - non-muscle invasive (75%) → >80% overall survival
 - ♦ 15% of these will progress to invasive UCC
 - ♦ the majority of these patients will have recurrence
 - invasive (25%) → 50-60% 5 yr survival
 - ♦ 85% have no prior Hx of superficial UCC (i.e. *de novo*)
 - ♦ 50% have occult metastases at diagnosis, and most of these will develop overt clinical evidence of metastases within 1 yr – lymph nodes, lung, peritoneum, liver
- carcinoma *in situ* → flat, non-papillary erythematous lesion characterized by dysplasia confined to urothelium
 - more aggressive, worse prognosis
 - usually multifocal
 - may progress to invasive UCC

Clinical Features

- asymptomatic (20%)
- hematuria (key symptom: 85-90% at the time of diagnosis)
- pain (50%) → location determined by size/extent of tumour (i.e. flank, suprapubic, perineal, abdominal, etc.)
- clot retention (17%)
- storage urinary symptoms → consider carcinoma *in situ*
- palpable mass on bimanual exam → likely muscle invasion
- obstruction of ureters → hydronephrosis and uremia (nausea, vomiting, and diarrhea)

Investigations

- U/A, urine C&S, urine cytology
- U/S
- CT scan with contrast → look for filling defect
- cystoscopy with biopsy (gold standard)
- biopsy to establish diagnosis and to determine depth of penetration
- specific bladder tumour markers (e.g. NMP-22, BTA, Immunocyt, FDP)

Grading

- low grade: ≤10% invasive, 60% recur
- high grade: 50-80% are invasive or should progress to invasive over time

Staging

- for invasive disease: CT or MRI, CXR, LFTs, extended electrolytes (Ca^{2+} , Mg^{1+} , PO_4^{3-}) (metastatic workup)

The “field defect” theory helps to explain why UCC has multiple lesions and has a high recurrence rate. The entire urothelium (pelvis to bladder) is bathed in carcinogens

The ENTIRE urinary tract must be evaluated in patients with hematuria unless there is clear evidence of glomerular bleeding (e.g. red cell casts, dysmorphic RBCs, etc.)

Cystoscopy is the initial procedure of choice for the diagnosis and staging of urothelial malignancy

Unexplained hematuria in any individual >40 yr old must be investigated to rule out a malignancy

Tumour grade is the single most important prognostic factor for progression

Table 18. 2010 TNM Classification of Bladder Carcinoma

T	N	M
TX: Primary tumour cannot be assessed	NX: Lymph nodes cannot be assessed	M0: No distant metastasis
T0: No evidence of primary tumour		
Ta: Noninvasive papillary carcinoma	N0: No lymph node metastasis	M1: Distant metastasis
Tis: Carcinoma <i>in situ</i> : "flat tumour"		
T1: Tumour invades subepithelial connective tissue	N1: Single regional lymph node metastasis in the true pelvis (hypogastric, obturator, external iliac, or presacral lymph node)	
T2: Tumour invades muscularis propria	N2: Multiple regional lymph node metastasis in the true pelvis (hypogastric, obturator, external iliac, or presacral lymph node metastasis)	
pT2a: Tumour invades superficial muscularis propria (inner half)		
pT2b: Tumour invades deep muscularis propria (outer half)	N3: Lymph node metastasis to the common iliac lymph nodes	
T3: Tumour invades perivesical tissue		
pT3a: Microscopically		
pT3b: Macroscopically (extravesical mass)		
T4: Tumour invades any of the following: prostatic stroma, seminal vesicles, uterus, vagina, pelvic wall, abdominal wall		
T4a: Tumour invades prostatic stroma, uterus, vagina		
T4b: Tumour invades pelvic wall, abdominal wall		

Figure 11. Urothelial carcinoma of bladder

Treatment

- superficial (non-muscle invasive) disease: Tis, Ta, T1
 - low-grade disease
 - single dose mitomycin c within 24 hours of resection reduces recurrence rates
 - high-grade
 - TURBT ± intravesical chemo/immuno-therapy (e.g. BCG, mitomycin C) to decrease recurrence rate
 - maintenance with intravesical chemotherapy with BCG for 3 cycles every 3 mo, may be continued for 2-3 yr
- invasive disease: T2a, T2b, T3
 - radical cystectomy + pelvic lymphadenectomy with urinary diversion (e.g. ileal conduit, Indiana pouch, ileal neobladder) or TURBT + chemo-radiation (bladder sparing) for small tumours with non-obstructed ureters
 - neo-adjuvant chemotherapy prior to cystectomy may also be done
 - use of adjuvant chemotherapy after definitive local treatment is controversial
- advanced/metastatic disease: T4a, T4b, N+, M+
 - initial combination of systemic chemotherapy ± irradiation ± surgery

Prognosis

- depends on stage, grade, size, number of lesions, recurrence and presence of CIS
 - T1: 90% 5 yr survival
 - T2: 55% 5 yr survival
 - T3: 20% 5 yr survival
 - T4/N+/M+: <5% 5 yr survival

Prostate Cancer

Etiology

- not known
- risk factors
 - increased incidence in persons of African descent
 - high dietary fat = 2x risk

Neoadjuvant Chemotherapy plus Cystectomy Compared with Cystectomy Alone for Locally Advanced Bladder Cancer

NEJM 2003;349:859-866

Study: Randomized clinical trial.

Patients: 317 patients with transitional-cell carcinoma of the bladder (T2N0M0 to T4aN0M0).

Intervention: Randomized to undergo radical cystectomy or to receive three cycles of combined chemotherapy (methotrexate, vinblastine, doxorubicin, and cisplatin) followed by radical cystectomy.

Main Outcome: Survival. Secondary objective was to quantify down-staging of tumour following chemotherapy.

Results: At 5 yr after treatment initiation, 57% of the combination-therapy group vs. 43% of the cystectomy group were alive ($p=0.06$). In the combination-therapy group, 38% of the patients were pathologically free of cancer at the time of cystectomy vs. 15% of the cystectomy-only group at the time of surgery ($p<0.001$).

Conclusions: For locally advanced bladder carcinoma, neoadjuvant chemotherapy significantly reduces tumour volume and also improves survival.

Figure 12. Ileal conduit, Indiana pouch, ileal neobladder

- family Hx
 - ♦ 1st degree relative = 2x risk
 - ♦ 1st and 2nd degree relatives = 9x risk

Epidemiology

- most prevalent cancer in males
- 3rd leading cause of male cancer deaths (following lung and colon)
- up to 50% risk of CaP at age 50
- lifetime risk of death from CaP is 3%
- 75% diagnosed between ages of 60 and 85; mean age at diagnosis is 72

Pathology

- adenocarcinoma
 - >95%, often multifocal
- urothelial carcinoma of the prostate (4.5%)
 - associated with UCC of bladder; does NOT follow TNM staging below; not hormone-responsive
- endometrial (rare)
 - carcinoma of the utricule

Anatomy (see Figure 7, U7)

- 60-70% of nodules arise in the peripheral zone
- 10-20% arise in the transition zone
- 5-10% arise in the central zone

Clinical Features

- usually asymptomatic
- most commonly detected by DRE, elevated PSA, or as an incidental finding on TURP
 - DRE: hard irregular nodule or diffuse dense induration involving one or both lobes
 - PSA: see *Prostate Cancer Screening*, U26
- locally advanced disease
 - storage and voiding symptoms, ED (all uncommon without spread)
- metastatic disease
 - bony metastases to axial skeleton common
 - visceral metastases are less common (liver, lung, and adrenal gland most common sites)
 - leg pain and edema with nodal metastases obstructing lymphatic and venous drainage

Methods of Spread

- local invasion
- lymphatic spread to regional nodes
 - obturator > iliac > presacral/para-aortic
- hematogenous dissemination occurs early

Investigations

- DRE
- PSA elevated in the majority of patients with CaP
- TRUS-guided needle biopsy
- bone scan may be omitted in untreated CaP with PSA <10 ng/mL
- CT scanning to assess metastases
- MRI: being investigated for possible role in detection, staging, MRI-guided biopsying and active surveillance

Table 19. 2010 TNM Classification of Prostate Carcinoma

T	N	M
T1: clinically undetectable tumour, normal DRE and TRUS T1a: tumour incidental histologic finding in <5% of tissue resected T1b: tumour incidental histologic finding in >5% of tissue resected T1c: tumour identified by needle biopsy (due to elevated PSA level)	NX: regional lymph nodes were not assessed N0: no regional lymph node metastasis N1: spread to regional lymph nodes	M0: no distant metastasis M1: distant metastasis M1a: nonregional lymph nodes M1b: bone(s) M1c: other site(s) with or without bone disease
T2: palpable, confined to prostate T2a: tumour involving ≤ one half of one lobe T2b: tumour involving > one half of one lobe, but not both lobes T2c: tumour involving both lobes		
T3: tumour extends through prostate capsule T3a: extracapsular extension (unilateral or bilateral) T3b: tumour invading seminal vesicle(s)		
T4: tumour invades adjacent structures (besides seminal vesicles)		

Table 20. Prostate Cancer Mortality Risk

	Low Risk	Intermediate Risk (if any of following)	High Risk (if any of following)
PSA	<10	10-20	>20
Gleason Score	<7	7	8-10
Stage	pT1-2a	pT2b-T2c	pT3/4

Treatment

- T1/T2 (localized, low-risk)
 - if adequate life expectancy or no other significant comorbidities, consider active surveillance vs. definitive local treatment (RP, brachytherapy, or EBRT)
 - no difference in cure rate between definitive treatment modalities
 - in older population: watchful waiting + palliative treatment for symptomatic progression
- T1/T2 (intermediate or high-risk)
 - definitive therapy over active surveillance
- T3, T4
 - EBRT + androgen deprivation therapy or RP + adjuvant EBRT
- N >0 or M >0
 - requires hormonal therapy/palliative radiotherapy for metastases; may consider combined androgen blockade
 - bilateral orchiectomy – removes 90% of testosterone
 - GnRH agonists (e.g. leuprolide, goserelin)
 - GnRH antagonist (e.g. degarelix)
 - estrogens (e.g. diethylstilbestrol [DES])
 - antiandrogens (e.g. bicalutamide)
 - local irradiation of painful secondaries or half-body irradiation
- hormone-refractory prostate cancer
 - chemotherapy: docetaxel, cabazitaxel, sipuleucel-T

Table 21. Treatment Options for Localized Prostate Cancer

Modality	Population Considered	Limitations
Watchful Waiting	Short life expectancy (<5-10 yr); will likely only receive non-curative hormonal therapy if disease progresses	Disease progression
Active Surveillance (serial PSA, DRE, and biopsies)	Low grade disease, good follow-up; is still considering more curative treatment if disease progresses	Disease progression; decrease in QOL associated with serial testing; risks associated with biopsies; no optimal monitoring schedule has been defined to date
Brachytherapy	Low volume, low PSA (<10), low grade	ED (50%), long-term effectiveness not well-established
EBRT	Locally advanced disease, older patients	Radiation proctitis (5%), ED (50%), risk of rectal cancer
RP	Young patients (<75 yr), high-risk disease	Incontinence (10%), ED (30-50%)

*Other options include cryosurgery, HIFU, hormonal ablation

Prognosis

- T1-T2: comparable to normal life expectancy
- T3-T4: 40-70% 10-yr survival
- N+ and/or M+: 4 % 5 yr survival
- prognostic factors: tumour stage, tumour grade, PSA value, PSA doubling time

Prostate Cancer Screening

Digital Rectal Exam

- should be included as part of initial screening
- suspicious findings: abnormal feeling, nodularity, focal lesion, discrete change in texture/fullness/symmetry

Prostate Specific Antigen

- glycoprotein produced by epithelial cells of prostate gland
- leaks into circulation in setting of disrupted glandular architecture
- value of <4 ng/mL traditionally considered as cut-off to differentiate normal from pathologic value, but no single justifiable cutpoint
- measured serum PSA is a combination of free (15%) and bound PSA (85%)
- PSA velocity, PSA density, and free:total PSA: all intended to increase sensitivity and specificity of serum PSA values
 - association of increased CaP rates with decreased free are total PSA, elevated PSA velocity and density

Screening Recommendations

- conflicting evidence regarding mortality reduction with PSA-based screening and debate regarding overdiagnosis/overtreatment

Radical Prostatectomy vs. Watchful Waiting in Early Prostate Cancer (Scandinavian Prostate Cancer Group Study)

NEJM 2011;364:1708-1717

Study: Randomized clinical trial comparing watchful waiting with radical prostatectomy for localized prostate cancer.

Methods: 695 men from 14 centres in Finland, Sweden, and Iceland with newly diagnosed, localized prostate cancer were included in this study.

Main Outcomes: Mortality, distant metastases, local progression.

Results: For men with low-risk prostate cancer (PSA <10, Gleason score <7), at 15 yr after treatment initiation, the relative risk of death due to prostate cancer in the radical prostatectomy group versus watchful waiting was 0.62 (p=0.01). The cumulative incidence of death from prostate cancer after radical prostatectomy was high as compared with other studies.

Conclusions: Radical prostatectomy was associated with reduced rate of death due to prostate cancer.

Radical Prostatectomy vs. Observation for Localized Prostate Cancer (Prostate Cancer Intervention vs. Observation Trial (PIVOT) Study Group)

NEJM 2012;367:203-213

Study: Randomized clinical trial comparing observation with radical prostatectomy for localized prostate cancer.

Methods: 731 men at 52 United States centres with localized prostate cancer participated.

Main Outcomes: Mortality, bone metastases, surgical morbidity.

Results: Radical prostatectomy did not reduce all-cause or prostate cancer mortality relative to observation (relative risk 0.60, p=0.09), through at least 12 yr of follow-up.

Conclusions: Observation is recommended for localized prostate cancer, especially in men with low PSA and low-risk disease.

Causes of Increased PSA

BPH, prostatitis, prostatic ischemia/infarction, prostate biopsy/surgery, prostatic massage, acute urinary retention, urethral catheterization, cystoscopy, TRUS, strenuous exercise, perineal trauma, ejaculation, acute renal failure, coronary bypass graft, radiation therapy

PSA is specific to the PROSTATE, but NOT to prostate cancer

- Long-Term Care and United States Preventative Services Task Force all recommend against PSA testing as a population-wide screening tool
- however, serum PSA screening recommended in any man with >10 yr life-expectancy and any of the following
 - suspicious finding on DRE
 - moderate-severe LUTS
 - high risk individuals
 - investigating secondary carcinoma of unknown origin to rule out CaP as primary

Canadian Urological Association Guidelines (2011) re: CaP Screening

- harms and benefits of PSA testing must be explained to the patient and an informed, shared decision to test must be established
- initial screening should include both serum PSA and DRE
- all men should be offered screening at age 50 if >10 yr life-expectancy
- high-risk individuals (family Hx of CaP or African ancestry) should be offered screening at age 40 if >10 yr life-expectancy
- standard has been annual screening, but q2-4yr screening acceptable
- no strict cutpoint for when to biopsy. Decision to biopsy should be based on more than a single PSA value
- *new guidelines under development, however, AUA guidelines recommend against universal routine PSA screening for CaP

Screening for Prostate Cancer

Cochrane DB Syst Rev 2013;1:CD004720

Background: Screening for prostate cancer has an unclear benefit for reducing prostate cancer-specific mortality and morbidity.

Study: Systematic review of randomized clinical trials of screening vs no screening. A total of 31 trials were retrieved for this review.

Results: A meta-analysis of 5 RCTs with 341,342 participants was done. Collectively, there was no significant reduction in prostate cancer-specific mortality within 10 yr of follow-up. Screening procedures and biopsies were commonly associated with bleeding, bruising, and short-term anxiety; subsequent over-diagnosis and overtreatment resulted in additional harms, some severe.

Conclusions: Men who have a life expectancy less than 10-15 yr should be informed that screening for prostate cancer is unlikely to be beneficial. Significant harms are associated with screening, over-diagnosis, and overtreatment.

Testicular Tumours

Etiology/Risk Factors

- cryptorchidism, atrophy, sex hormones, HIV infection, infertility, family Hx, past Hx of testicular cancer

Epidemiology

- rare, but most common solid malignancy in young males 15-34 yr
- any solid testicular mass or acute hydrocoele in young patient – must rule out malignancy
- slightly more common in right testis (corresponds with slightly higher incidence of right-sided cryptorchidism)
- 2-3% bilateral (simultaneously or successively)

Pathology

- primary
 - 1% of all malignancies in males
 - cryptorchidism has increased risk (10-40x) of malignancy
 - 95% are germ cell tumours (all are malignant)
 - ♦ seminoma (35%) → classic, anaplastic, spermatocytic
 - ♦ NSGCT → embryonal cell carcinoma (20%), teratoma (5%), choriocarcinoma (<1%), yolk sac (<<1%), mixed cell type (40%)
 - 5% are non-germ cell tumours (usually benign) → Leydig (testosterone, precocious puberty), Sertoli (gynecomastia, decreased libido)
- secondary
 - male >50 yr
 - usually lymphoma or metastases (e.g. lung, prostate, GI)

Clinical Features

- **painless** testicular enlargement (painful if intratesticular hemorrhage or infarction)
- dull, heavy ache in lower abdomen, anal area or scrotum
- associated hydrocoele (10%)
- coincidental trauma (10%)
- infertility (rarely presenting complaint)
- gynecomastia due to secretory tumour effects
- supraclavicular and inguinal lymphadenopathy
- abdominal mass (retroperitoneal lymph node mets)

Methods of Spread

- local spread follows lymphatics
 - right → medial, paracaval, anterior and lateral nodes
 - left → left lateral and anterior paraaortic nodes
 - “cross-over” metastases from right to left are fairly common, but no reports from left to right
- hematogenous most commonly to lung, liver, bones, and kidney

Investigations

- diagnosis is established by pathological evaluation of specimen obtained by radical inguinal orchidectomy
- tumour markers (β-hCG, LDH, AFP)
 - β-hCG and AFP are positive in 85% of non-seminomatous tumours
 - elevated marker levels return to normal post-operatively if no metastasis
 - β-hCG positive in 7% of pure seminomas, AFP never elevated with seminoma
- testicular U/S (hypoechoic area within tunica albuginea = high suspicion of testicular cancer)
- evidence of testicular microlithiasis is not a risk factor for testicular cancer
- needle aspiration contraindicated

Testes and scrotum have different lymphatic drainage, therefore trans-scrotal approach for biopsy or orchiectomy should be avoided

Staging

- Clinical: CXR (lung mets), markers for staging (β -hCG, AFP, LDH), CT abdomen/pelvis (retroperitoneal lymphadenopathy)
 - Stage I: disease limited to testis, epididymis, or spermatic cord
 - Stage II: disease limited to the retroperitoneal nodes
 - Stage III: disease metastatic to supradiaphragmatic nodal or visceral sites

Table 22. 2010 TNM Classification of Testicular Carcinoma

T	N	M
Tis: intratubular germ cell neoplasia	N status: same as RCC	M0: no distant mets
T1: limited to testis and epididymis without vascular/lymphatic invasion		M1: distant mets
T2: limited to testis and epididymis with vascular/lymphatic invasion		M1a: nonregional lymph node(s) or pulmonary mets
T3: invasion of the spermatic cord \pm vascular/lymphatics		M1b: distant mets other than to regional lymph nodes and lung
T4: invasion of the scrotum \pm vascular/lymphatics		

Management

- orchiectomy through inguinal ligament for all stages
- consider sperm banking, testicular prosthesis
- adjuvant therapies

Prognosis

- 99% cured with stage I and II disease
- 70-80% complete remission with advanced disease

Orchiopexy

Surgical descent (orchiopexy) of undescended testis does not eliminate the risk of malignancy, but allows for earlier detection by self-examination and reduces the risk of infertility

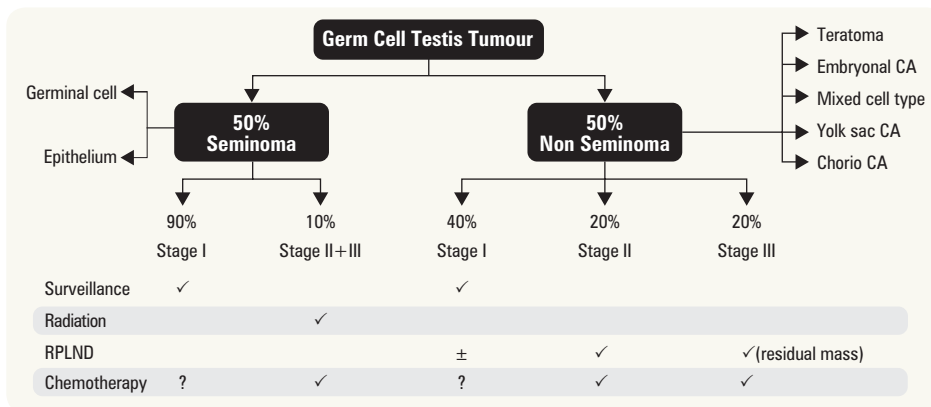

Figure 13. Adjuvant management of testicular cancer post-orchiectomy

Adapted from Dr. MAS Jewett

Penile Tumours

Epidemiology

- rare (<1% of cancer in males in U.S.)
- most common in 6th decade

Benign

- cyst, hemangioma, nevus, papilloma

Pre-Malignant

- balanitis xerotica obliterans, leukoplakia, Buschke-Lowenstein tumour (large condyloma)

Pre-invasive Cancer

- carcinoma *in situ*
 - Bowen's disease \rightarrow crusted, red plaques on the shaft
 - erythroplasia of Queyrat \rightarrow velvet red, ulcerated plaques on the glans
 - treatment options: local excision, laser, radiation, topical 5-fluorouracil

Malignant

- risk factors
 - chronic inflammatory disease
 - STI
 - phimosis
 - uncircumcised penis
- 2% of all urogenital cancers
- SCC (>95%), basal cell, melanoma, Paget's disease of the penis (extremely rare)
- definitive diagnosis requires full thickness biopsy of lesion
- lymphatic spread (superficial/deep inguinal nodes \rightarrow iliac nodes) >> hematogenous

Treatment

- wide surgical excision with tumour-free margins (dependent on extent and area of penile involvement) ± lymphadenectomy
- consider less aggressive treatment modalities in CIS (cryotherapy, laser therapy, etc.) if available

Scrotal Mass

Table 23. Differentiating between Scrotal Masses

Condition	Pain	Palpation	Additional Findings
Torsion	+	Diffuse tenderness Horizontal lie of testicle	Absent cremaster reflex, negative Prehn's sign
Epididymitis (U16)	+	Epididymal tenderness	Present cremaster reflex, positive Prehn's sign
Orchitis (U16)	+	Diffuse tenderness	Present cremaster reflex, positive Prehn's sign
Hematocele	+	Diffuse tenderness	No transillumination
Hydrocele	–	Testis not separable from hydrocele, cord palpable	Transillumination, Hx of trauma
Spermatocele	–	Testis separable from spermatocele, cord palpable	Transillumination
Varicocele	–	Bag of worms	No transillumination, increases in size with Valsalva, decrease in size if supine
Indirect Inguinal	– (+ if strangulated)	Testis separable from hernia, cord not palpable, cough impulse may transmit, may be reducible	No transillumination
Tumour	– (+ if hemorrhagic)	Hard lump/nodule	
Generalized/ Dependant edema	–	Diffuse swelling	Often post-operative or immobilized, check for liver dysfunction
Idiopathic	–		

Varicocele Grading

- Grade 1: Palpable only with Valsalva manoeuvre
- Grade 2: Palpable without Valsalva
- Grade 3: Visible through scrotal skin

Suspect a Retroperitoneal Mass/ Process in a Patient with a Varicocele if

- Acute onset
- Right sided (isolated)
- Palpable abdominal mass
- Does not reduce while supine

Indications for Treatment of Varicocele

- Impaired sperm quality or quantity
- Pain or dull ache affecting QOL
- Affected testis fails to grow in adolescents
- Cosmetic indications (especially in adolescents)

Table 24. Benign Scrotal Masses

Type	Varicocele	Spermatocele	Hydrocele	Testicular Torsion	Inguinal Hernia
Definition	Dilatation and tortuosity of pampiniform plexus	A benign, sperm filled epididymal retention cyst	Collection of serous fluid that results from a defect or irritation in the tunica vaginalis	Twisting of the testicle causing venous occlusion and engorgement as well as arterial ischemia and infarction	Protrusion of abdominal contents through the inguinal canal into the scrotum
Etiology	15% of men Due to incompetent valves in the testicular veins 90% left sided	Multiple theories, including: Distal obstruction Aneurysmal dilations of the epididymis Agglutinated germ cells	Usually idiopathic Found in 5-10% testicular tumours Associated with trauma/infection Communicating: patent processus vaginalis, changes size during day (peds) Non-communicating: non-patent processus vaginalis (adult)	Trauma Cryptorchidism "Bell clapper deformity" Many occur in sleep (50%) Necrosis of glands in 5-6 h	Indirect (through internal ring, often into scrotum): congenital Direct (through external ring, rarely into scrotum): abdominal muscle weakness
Hx/P/E	"Bag of worms" Often painless Pulsates with Valsalva	Non-tender, cystic mass Transilluminates	Non-tender, intrascrotal mass Cystic Transilluminates	Acute onset severe scrotal pain, swelling GI upsets cases Retracted and transverse testicle (horizontal lie) Negative Phren's sign Absent cremasteric reflex	A small bulge in the groin that may increase in size with Valsalva and disappear when lying down Can present as a swollen or enlarged scrotum Discomfort or sharp pain – especially when straining, lifting, or exercising
Investigations	P/E Valsalva	P/E U/S to rule out tumour	U/S to rule out tumour	U/S with colour flow Doppler probe over testicular artery Decrease uptake on ^{99m} Tc-pertechnetate scintillation scan (doughnut sign)	Hx and P/E Invagination of the scrotum Valsalva
Treatment	Conservative Surgical ligation of testicular veins Percutaneous vein occlusion (balloon, sclerosing agents) Repair may improve sperm count/motility 50-75%	Conservative Avoid needle aspiration as it can lead to infection, reaccumulation and spilling of irritating sperm within scrotum Excise if symptomatic	Conservative Needle drainage Surgical	Emergency surgical exploration and bilateral orchiopexy Orchiectomy if poor prognosis	Surgical repair

TORSION OF TESTICULAR APPENDIX

- twisting of testicular/epididymal vestigial appendix

Signs and Symptoms

- clinically similar to testicular torsion, but vertical lie and cremaster reflex preserved
- “blue dot sign”
 - blue infarcted appendage seen through scrotal skin (can usually be palpated as small, tender lump)

Treatment

- analgesia – most will subside over 5-7 d
- surgical exploration and excision if refractory pain

HEMATOCELE

- trauma with bleed into tunica vaginalis
- U/S helpful to exclude fracture of testis which requires surgical repair

Treatment

- ice packs, analgesics, surgical repair

Acute scrotal swelling/pain in young boys is torsion until proven otherwise

Transillumination refers to if light is able to transmit through tissue (i.e. due to excess fluid)

Differential of a Benign Scrotal Mass

HIS BITS

Hydrocele

Infection (epididymitis/orchitis)

Sperm (spermatocele)

Blood (hematocele)

Intestines (hernia)

Torsion

Some veins (varicocele)

Penile Complaints

Table 25. Penile Complaints

Type	Peyronie's Disease	Priapism	Paraphimosis	Phimosis	Premature Ejaculation
Definition	Benign curvature of penile shaft secondary to fibrous thickening of tunica albuginea	Prolonged erection lasting >4 h in the absence of sexual excitement/desire	Foreskin caught behind glans leading to edema → inability to reduce foreskin	Inability to retract foreskin over glans penis	Ejaculation prior to when one or both partners desire it, either before or soon after penetration
Etiology	Etiology unknown Trauma/repeated inflammation Familial predisposition Associated with DM, vascular disease, autoimmunity, Dupuytren's contracture, erectile dysfunction	50% idiopathic Ischemic (common) <ul style="list-style-type: none"> Thromboembolic (sickle cell) Non-Ischemic <ul style="list-style-type: none"> Trauma Medications Neurogenic 	Iatrogenic (post cleaning/instrumentation) Trauma Infectious (balanitis, balanoposthitis)	Congenital (90% natural separation by age 3) Balanitis Poor Hygiene	Psychological factors Primary: no period of acceptable control Secondary: symptoms after a period of control, not associated with general medical condition
Hx/P/E	Penile curvature/shortening Pain with erection Poor erection distal to plaque	Painful erection ± signs of necrosis	Painful, swollen glans penis, foreskin Constricting band proximal to corona Dysuria, decreased urinary stream in children	Limitation and pain when attempting to retract foreskin Balanoposthitis (infection of prepuce)	Ejaculatory latency ≥1 min Inability to control or delay ejaculation Psychological distress
Investigations	Hx and P/E	Hx and P/E Cavernosal blood gas analysis	Hx and P/E	Hx and P/E	Hx and P/E Testosterone levels if in conjunction with impotence
Treatment	Watchful waiting (spontaneous resolution in up to 50%) Intralesional or topical verapamil Incision/excision of plaque Shortening of less affected side ± penile prosthesis	Treat reversible causes High-flow: <ul style="list-style-type: none"> Self-limited Consider arterial embolization Low-flow: <ul style="list-style-type: none"> Needle aspirated decompression Phenylephrine intracorporeal injection q3-5min Surgical shunt no response within 1 h 	Manual pressure (with analgesia) Dorsal slit Circumcision (urgent or electively to prevent recurrence)	Proper hygiene Topical corticosteroids Dorsal slit Circumcision	rule out medical condition Address psychiatric concerns, counselling Medication: <ul style="list-style-type: none"> SSRI or clomipramine Topical lidocaine, prilocaine

Erectile Dysfunction

Definition

- consistent (>3 mo duration) or recurrent inability to obtain or maintain an adequate erection for satisfactory sexual performance

Physiology

- erection involves the coordination of psychologic, neurologic, hemodynamic, mechanical, and endocrine components
- nerves: sympathetic (T11-L2), parasympathetic (S2-4), somatic (dorsal penile/pudendal nerves [S2-4])

- erection (“POINT”)
 - parasympathetics → release of nitric oxide (NO) → increased cGMP levels within corpora cavernosa leading to:
 1. arteriolar dilatation
 2. sinusoidal smooth muscle relaxation → increased arterial inflow and compression of penile venous drainage (decreased venous outflow)
- emission (“SHOOT”)
 - sensory afferents from glans
 - secretions from prostate, seminal vesicles, and ejaculatory ducts enter prostatic urethra (sympathetics)
- ejaculation (“SHOOT”)
 - bladder neck closure (sympathetic)
 - spasmodic contraction of bulbo-cavernosus and pelvic floor musculature (somatic)
- detumescence
 - sympathetic nerves, norepinephrine, endothelin-1 → arteriolar and sinusoidal constriction → penile flaccidity

Classification

Table 26. Classification of Erectile Dysfunction

	Psychogenic	Organic
Proportion	10%	90%
Onset	Sudden	Gradual
Frequency	Sporadic	All circumstances
Variation	With partner and circumstance	No
Age	Younger	Older
Organic Risk Factors (HTN, DM, dyslipidemia)	No organic risk factors	Risk factors present
Nocturnal/AM Erection	Present	Absent

Etiology (“IMPOTENCE”)

- Iatrogenic: pelvic surgery, pelvic radiation
- Mechanical: Peyronie’s, post-priapism
- Psychological: depression, stress, anxiety, PTSD, widower syndrome
- Occlusive vascular: arterial HTN, DM, smoking, hyperlipidemia, PVD, venous (impaired veno-occlusion)
- Trauma: penile/pelvic, bicycling
- Extra factors: renal failure, cirrhosis, COPD, sleep apnea, malnutrition
- Neurogenic: CNS (e.g. Parkinson’s, MS, spinal cord injury, Guillain-Barré, spina bifida, stroke), PNS (e.g. DM, peripheral neuropathy)
- Chemical: antihypertensives, sedatives, antidepressants, antipsychotics, anxiolytics, anticholinergics, antihistamines, anti-androgens (including 5- α reductase inhibitors), statins, GnRH agonists, illicit drugs
- Endocrine: DM, hypogonadism, hyperprolactinemia, hypo/hyperthyroid

Diagnosis

- complete Hx (include sexual, medical, and psychosocial aspects)
- self-administered questionnaires (e.g. International Index of Erectile Function, Sexual Health Inventory for Men Questionnaire, ED Intensity Scale, ED Impact Scale)
- focused P/E, including vascular and neurologic examinations, secondary sexual characteristics
- lab investigations, dependent on clinical picture
 - risk factor evaluation: fasting blood glucose or HbA1c, cholesterol profile
 - optional: TSH, CBC, U/A, testosterone (free and total), prolactin, LH
- specialized testing including nocturnal penile tumescence monitoring usually unnecessary
- psychological/psychiatric assessment could be considered to rule out performance anxiety
- evaluation of penile vasculature only relevant with past history of trauma (i.e. pelvic fracture)

Treatment

- can often be managed by family doctor, see sidebar for when to refer
- must fully inform patient/partner of options, benefits and complications
- non-invasive
 - lifestyle changes (alcohol, smoking), psychological (sexual counseling and education)
 - change precipitating medications
 - treat underlying causes (DM, CVD, HTN, endocrinopathies)

Erections POINT AND SHOOT
parasympathetics = **point**; and
sympathetics/somatics = **shoot**

Figure 14. Peyronie’s disease

Penile vascular abnormalities may be a marker of risk for CV disease. Young men with vascular ED have 50x higher risk of having a CV event

Testosterone deficiency is an uncommon cause of ED

When to Consider Referral

FAT PEN

Failed medical therapy
penile **A**natomic abnormality
pelvic/perineal **T**rauma
Psychogenic cause
Endocrinopathy
vascular/**N**eurologic assessment

- minimally invasive
 - oral medication (see *Common Medications*, U43)
 - ♦ sildenafil, tadalafil, vardenafil, avanafil: inhibits PDE-5 to increase intracavernosal cyclic GMP levels
 - all four have similar effectiveness, but tadalafil has certain advantages: earlier onset, longer half-life, no cyanopsia, can be taken on empty or full stomach (others better on empty stomach)
 - vacuum devices: draw blood into penis via negative pressure, then put ring at base of penis once erect
 - MUSE: male urethral suppository for erection – vasoactive substance (PGE1) capsule inserted into urethra
- invasive
 - intracavernous vasodilator injection/self-injection
 - ♦ triple therapy (papaverine, phentolamine, PGE1) or PGE1 alone
 - ♦ complications: priapism (overdose), thickening of tunica albuginea at site of repeated injections (Peyronie's plaque) and hematoma
- surgical
 - penile implant (last resort): malleable or inflatable
 - penile artery reconstruction (in young men with isolated vascular lesion – investigational)

PDE-5 inhibitors are contraindicated in patients on nitrates/nitroglycerin due to severe hypotension

Initial trial of MUSE® or intracavernosal injection should be done under medical supervision

Trauma

- see [Emergency Medicine](#), ER41

Renal Trauma

Classification According to Severity

- minor
 - contusions and superficial lacerations/hematomas: 90% of all blunt traumas, surgical exploration seldom necessary
- major
 - laceration that extends into medulla and collecting system, major renal vascular injury, shattered kidney

Etiology

- 80% blunt (MVC, assaults, falls) vs. 20% penetrating (stab wounds and gunshots)

Clinical Features

- mechanism of injury raises suspicion
- can be hemodynamically unstable secondary to renal vascular injury and/or other sustained injuries: ABCs
- upper abdominal tenderness, flank tenderness, flank contusions, lower rib/vertebral transverse process fracture

Investigations

- U/A
 - hematuria: requires workup but degree does not correlate with the severity of injury
- imaging
 - CT (contrast, triphasic) if patient stable: look for renal laceration, extravasation of contrast, retroperitoneal hematoma, and associated intra-abdominal organ injury

Staging (does not necessarily correlate well with clinical status)

- I: contusion/hematoma
- II: <1 cm laceration without urinary extravasation
- III: >1 cm laceration without urinary extravasation
- IV: urinary extravasation
- V: shattered kidney or avulsion of pedicle

Treatment

- microscopic hematuria + isolated well-staged minor injuries → no hospitalization
- gross hematuria + contusion/minor lacerations → hospitalize, bedrest, repeat CT if bleeding persists
- surgical intervention/minimally invasive angiography and embolization
 - absolute indications
 - ♦ hemorrhage and hemodynamic instability

- relative indications
 - ♦ non-viable tissue and major laceration
 - ♦ urinary extravasation
 - ♦ vascular injury
 - ♦ expanding or pulsating peri-renal mass
 - ♦ laparotomy for associated injury
- follow-up with U/S or CT before discharge, and at 6 wk

Complications

- HTN in 5% of renal trauma

Bladder Trauma

Classification

- contusions: no urinary extravasation, damage to mucosa or muscularis
- intraperitoneal ruptures: often involve the bladder dome
- extraperitoneal ruptures: involve anterior or lateral bladder wall in full bladder

Etiology

- blunt (MVC, falls, and crush injury) vs. penetrating trauma to lower abdomen, pelvis, or perineum
- blunt trauma is associated with pelvic fracture in 97% of cases

Clinical Features

- abdominal tenderness, distention, peritonitis, and inability to void
- can be hemodynamically unstable secondary to pelvic fracture, other sustained injuries: ABCs
- suprapubic pain

Investigations

- U/A: gross hematuria in 90%
- imaging (including CT cystogram and post-drainage films for extravasation)

Treatment

- penetrating trauma → surgical exploration
- contusion → urethral catheter until hematuria completely resolves
- extraperitoneal bladder perforations → typically non-operative with foley insertion, and follow with cystograms
 - surgery if: infected urine, rectal/vaginal perforation, bony spike into bladder, laparotomy for concurrent injury, bladder neck involvement, persistent urine leak and failed conservative management
- intraperitoneal rupture usually requires surgical repair and suprapubic catheterization

Complications

- complications of bladder injury itself are rare
- mortality is around 20%, and is usually due to associated injuries rather than bladder rupture

Urethral Injuries

Etiology

- posterior urethra
 - common site of injury is junction of membranous and prostatic urethra due to blunt trauma, MVCs, pelvic fracture
 - shearing force on fixed membranous and mobile prostatic urethra
- anterior urethra
 - straddle injury can crush bulbar urethra against pubic rami
- other causes
 - iatrogenic (instrumentation, prosthesis insertion), penile fracture, masturbation with urethral manipulation
- always look for associated bladder rupture

Clinical Features

- blood at urethral meatus
- high-riding prostate on DRE
- swelling and butterfly perineal hematoma
- penile and/or scrotal hematoma
- sensation of voiding without U/O
- distended bladder

Investigations

- must perform RUG or cystoscopy prior to catheterization

Treatment

- simple contusions
 - no treatment
- partial urethral disruption
 - very gentle attempt at catheterization by urologist
 - with no resistance to catheterization → Foley x 2-3 wk
 - with resistance to catheterization → suprapubic cystostomy or urethral catheter alignment in OR
- periodic flow rates/urethrograms to evaluate for stricture formation
- complete disruption
 - immediate repair if patient stable, delayed repair if unstable (suprapubic tube in interim)

Complications

- stricture

All patients with suspected urethral injury should undergo RUG

Infertility

Definition

- failure to conceive after one year of unprotected, properly timed intercourse
- incidence
 - 15% of all couples
 - ~ 35-40% female, 20% male, 25-30% combined problem

Female Factors

- see [Gynecology](#), GY23

Male Factors

Male Reproduction

- hypothalamic-pituitary-testicular axis (HPTA)
 - pulsatile GnRH from hypothalamus acts on anterior pituitary stimulating release of LH and FSH
 - LH acts on Leydig (interstitial) cells → testosterone synthesis and secretion
 - FSH acts on Sertoli cells → structural and metabolic support to developing spermatogenic cells
 - FSH and testosterone support germ cells (responsible for spermatogenesis)
 - sperm route: epididymis → vas deferens → ejaculatory ducts → prostatic urethra

Etiology

- idiopathic (40-50% infertile males)
- testicular
 - varicocele (35-40% infertile males)
 - tumour
 - congenital (Klinefelter's triad: small, firm testes, gynecomastia, and azoospermia)
 - post-infectious (epididymo-orchitis, STIs, mumps)
 - uncorrected torsion
 - cryptorchidism (<5% of cases)
- obstructive
 - iatrogenic (surgery: see below)
 - infectious (gonorrhea, chlamydia)
 - trauma
 - congenital (absence of vas deferens, CF)
 - bilateral ejaculatory duct obstruction, epididymal obstructions
 - Kartagener's syndrome (autosomal recessive disorder causing defect in action of cilia)
- endocrine (see [Endocrinology](#), E48)
- HPTA (2-3%) e.g. Kallmann's syndrome (congenital hypothalamic hypogonadism), excess prolactin, excess androgens, excess estrogens
- other
 - retrograde ejaculation secondary to surgery
 - medications
 - drugs: marijuana, cocaine, tobacco, alcohol
 - increased testicular temperature (sauna, hot baths, tight pants or underwear)
 - chronic disease: e.g. liver, renal
 - unexplained infertility

Male Infertility Factors

SPERM COUNT
Systemic factor/Smoking
Psychological illness
Endocrinopathy
Retrograde ejaculation
Medications

Chronic disease
Obstructive
Unexplained
Narcotics
Testicular

History

- age of both partners
- medical: past illness, DM, trauma, CF, genetic syndromes, STIs, cryptorchidism
- surgical: vasectomy, herniorrhaphy, orchidopexy, prostate surgery
- fertility: pubertal onset, previous pregnancies, duration of infertility, treatments
- sexual: libido, erection/ejaculation, timing, frequency
- family Hx
- medications: cytotoxic agents, GnRH agonists, anabolic steroids, nitrofurantoin, cimetidine, sulfasalazine, spironolactone, α -blockers
- social Hx: alcohol, tobacco, cocaine, marijuana
- occupational exposures: radiation, heavy metals

Physical Exam

- general appearance: sexual development, gynecomastia, obesity
- scrotal exam: size, consistency, and nodularity of testicles; palpation of cord for presence of vas deferens; DRE; Valsalva for varicocele

Investigations

- semen analysis (SA) at least 2 specimens, collected 1-2 weeks apart
 - delivery to lab within 1 hour, 2-7 days of abstinence prior to collection
- hormonal evaluation
 - indicated with abnormal SA (rare to be abnormal with normal SA)
 - testosterone and FSH
 - serum LH and prolactin are measured if testosterone or FSH are abnormal
- genetic evaluation
 - chromosomal studies (Klinefelter's syndrome – XXY)
 - genetic studies (Y-chromosome microdeletion, CF gene mutation)
- immunologic studies (antisperm antibodies in ejaculate and blood)
- testicular biopsy
- scrotal U/S (varicocele, testicular size)
- vasography (assess patency of vas deferens)

Treatment

- assessment of partner
- lifestyle
 - regular exercise, healthy diet
 - eliminate alcohol, tobacco and illicit drugs
- medical
 - endocrine therapy (see [Endocrinology](#), E49)
 - treat retrograde ejaculation
 - discontinue anti-sympathomimetic agents, may start α -adrenergic stimulation (phenylpropanolamine, pseudoephedrine, or ephedrine)
 - treat underlying infections
- surgical
 - varicocelectomy (if indicated)
 - vasovasostomy (vasectomy reversal) or epididymovasostomy
 - transurethral resection of blocked ejaculatory ducts
- assisted reproductive technologies (ART)
 - refer to infertility specialist
 - sperm washing + intrauterine insemination (IUI)
 - *in vitro* fertilization (IVF)
 - intracytoplasmic sperm injection (ICSI) after CF screening of patient and partner in patients with congenital bilateral absence of vas deferens

Common Terminology on SA

- Teratospermia: Abnormal morphology
- Asthenospermia: Abnormal motility
- Oligospermia: Decreased sperm count
- Azoospermia: Absent sperm in semen
- Mixed types: i.e. oligoasthenospermia

Mutation of cystic fibrosis transmembrane conductance regulator (CFTR) gene is associated with congenital bilateral absence of vas deferens and epididymal cysts, even if patient manifests no symptoms of CF

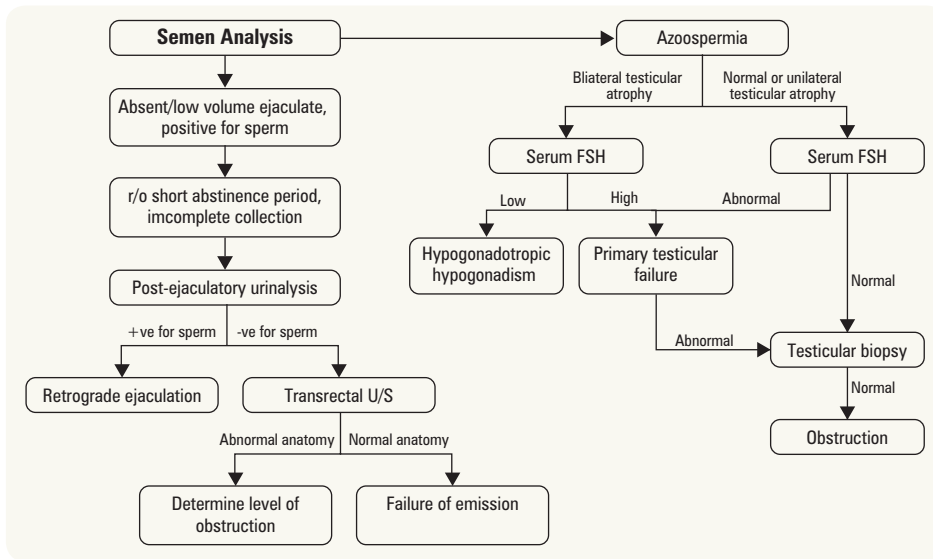

Figure 15. Infertility work up

WHO Guidelines

Normal Semen Values

- Volume: 2-5 mL
- Concentration: > 15 million sperm/mL
- Morphology: 30% normal forms
- Motility: > 40% adequate forward progression
- Liquefaction: complete in 20 min
- pH: 7.2-7.8
- WBC: <10/HPF or <10⁶ WBC/mL semen

Pediatric Urology

Congenital Abnormalities

- not uncommon; 1/200 have congenital abnormalities of the GU tract
- six common presentations of congenital urological abnormalities

1. ANTENATAL HYDRONEPHROSIS

Epidemiology

- 1-5% fetal U/S, detectable as early as first trimester
- most common urological consultation in perinatal period and one of most common U/S abnormalities of pregnancy

Differential Diagnosis

- UPJ or UVJ obstruction
- multi-cystic dysplastic kidney
- VUR
- PUVs (only in boys)
- duplication anomalies
- ureterocele
- ectopic ureter

Treatment

- antenatal *in utero* intervention rarely indicated unless evidence of PUVs with oligohydramnios

Majority of antenatal hydronephroses resolve during pregnancy or within the first year of life

2. POSTERIOR URETHRAL VALVES

Epidemiology

- the most common congenital obstructive urethral lesion in male infants

Pathophysiology

- abnormal mucosal folds at the distal prostatic urethra causing varying degrees of obstruction

Clinical Presentation

- dependent on age
 - antenatal: bilateral hydronephrosis, distended bladder, oligohydramnios
 - neonatal (recognized at birth): palpable abdominal mass (distended bladder, hydronephrosis), ascites (transudation of retroperitoneal urine), respiratory distress (pulmonary hypoplasia from oligohydramnios), weak urinary stream
 - neonatal (not recognized at birth): within weeks present with urosepsis, dehydration, electrolyte abnormalities, failure to thrive

- toddlers: UTIs or voiding dysfunction
- school-aged boys: voiding dysfunction → urinary incontinence
- associated findings include renal dysplasia and secondary VUR

Investigations

- most commonly recognized on prenatal U/S → bilateral hydronephrosis, thickened bladder, dilated posterior urethra ("keyhole sign"), oligohydramnios in a male fetus
- VCUg → dilated and elongated posterior urethra, trabeculated bladder, VUR

Treatment

- immediate catheterization to relieve obstruction, followed by cystoscopic resection of PUV when baby is stable
- if resection of PUV is not possible, vesicostomy is indicated

3. URETEROPELVIC JUNCTION OBSTRUCTION

Etiology

- unclear: adynamic ureteral segment, stenosis, strictures, extrinsic compression, stenosis, strictures, aberrant blood vessels
- can rarely be secondary to tumour, stone, etc, in children

Epidemiology

- the most common congenital defect of the ureter
- M:F = 2:1
- up to 40% bilateral, which may be associated with worse prognosis

Clinical Presentation

- symptoms depend on severity and age at diagnosis (mostly asymptomatic finding on antenatal U/S)
 - infants: abdominal mass, urinary infection
 - children: pain, vomiting, failure to thrive
- some cases are diagnosed after puberty and into adulthood
 - in adolescents and adults, the symptoms may be triggered by episodes of increased diuresis, such as following alcohol ingestion (Dietl's crisis)

Investigations

- antenatal U/S most common, Doppler U/S (rare), IVP (rare), and renal scan ± furosemide

Treatment

- surgical correction (pyeloplasty), consider nephrectomy if <15% differential renal function

4. VESICoureTERAL REFLUX

Definition

- retrograde passage of urine from the bladder, through the UVJ, into the ureter

Classification

- primary reflux: incompetent or inadequate closure of UVJ
 - lateral ureteral insertion, short submucosal segment
- secondary reflux: abnormally high intravesical pressure resulting in failure of UVJ closure
 - often associated with anatomic (PUV) or functional (neuropathic) bladder obstruction

Epidemiology

- estimated ~1% of newborns, but not well known
- incidence and clinical relevance higher in children with febrile UTIs and prenatal hydronephrosis
- risk factors: race (white > black), female gender, age (<2 yr), genetic predisposition

Investigations

- focused Hx, particularly of voiding dysfunction (frequency, urgency, diurnal enuresis, constipation, encopresis)
 - also screen for signs of infection (UTI, pyelonephritis, urosepsis) and renal failure (uremia, HTN)
- initial evaluation of renal status, growth parameters, and blood pressure is warranted in any child with VUR due to high incidence of renal scarring
 - height, weight, blood pressure
 - Cr
 - U/A, C&S
 - renal U/S
 - DMSA renal scan if at high risk (greater sensitivity in detecting structural defects associated with dysplasia, renal scarring or pyelonephritis; entails radiation exposure)
 - family screening is controversial

Figure 16. VUR grading
(based on cystogram)

Treatment

- spontaneous resolution in 60% of primary reflux
 - in lower grades (I-III), goal is to prevent infection or renal damage via medical treatment and monitoring
- medical treatment: daily ABx prophylaxis at half the treatment dose for acute infection (see Table 9 - TMP/SMX, trimethoprim, amoxicillin, or nitrofurantoin)
- surgical treatment: ureteral reimplantation ± ureteroplasty, or subureteral injection with bulking agents (Deflux® or Macroplastique®)
 - indications include failure of medical management, renal scarring (e.g. renal insufficiency, HTN), breakthrough UTIs, persistent high grade (IV or V) reflux

5. HYPOSPADIAS

Definition

- a condition in which the urethral meatus opens on the ventral side of the penis, proximal to the normal location in the glans penis
- depending on severity, may result in difficulty directing urinary stream, having intercourse or depositing sperm in vagina

Epidemiology

- very common; 1/300 live male births
- distal hypospadias more common than proximal
- white >> black
- may be associated with ventral penile curvature, disorders of sexual differentiation, undescended testicles or inguinal hernia

Treatment

- early surgical correction; optimal repair before 2 yr
- neonatal circumcision should be deferred because the foreskin may be utilized in the correction

6. EPISPADIAS-EXSTROPHY COMPLEX

Definition

- a spectrum of defects depending on the timing of the rupture of the cloacal membrane
 - bladder exstrophy: congenital absence of a portion of lower abdominal and anterior bladder wall, with exposure of the bladder lumen
 - cloacal exstrophy
 - exposed bladder and bowel with imperforate anus
 - associated with spina bifida in >50%
 - epispadias (least severe)
 - urethra opens on dorsal aspect of the penis, often associated with penile curvature

Etiology

- represents failure of closure of the cloacal membrane, resulting in the bladder and urethra opening directly through the abdominal wall

Epidemiology

- rare: incidence 1/30,000, M:F = 3:1 predominance
- high morbidity → multiple reconstructive surgeries, incontinence, infertility, reflux

Treatment

- surgical correction at birth
- later corrections for incontinence, VUR, and low bladder capacity may be needed

VUR Grading (based on cystogram)

- Grade I:** ureters only fill
- Grade II:** ureters and pelvis fill
- Grade III:** ureters and pelvis fill with some dilatation
- Grade IV:** ureters, pelvis, and calyces fill with significant dilatation
- Grade V:** ureters, pelvis, and calyces fill with major dilatation and tortuosity

Defer circumcision in patients with hypospadias

Figure 17. Classification of hypospadias (*account for 75%)

Nephroblastoma (Wilms' Tumour)

Etiology

- arises from abnormal proliferation of metanephric blastema

Epidemiology

- 5% of all childhood cancers, 5% bilateral
- most common primary malignant renal tumour of childhood
- average age of incidence is 3 yr

Clinical Features

- abdominal mass: large, firm, unilateral (80%)
- HTN (25%)
- flank tenderness
- microscopic hematuria
- nausea/vomiting

Treatment

- always investigate contralateral kidney and renal vein (for tumour thrombus)
- unilateral disease: radical nephrectomy ± radiation ± chemotherapy
- bilateral disease: nephron-sparing surgery following neoadjuvant chemotherapy

Prognosis

- 5 yr survival 80%

Cryptorchidism/Ectopic Testes

Definition

- abnormal location of testes somewhere along the normal path of descent (external inguinal ring > inguinal canal > abdominal)
- ectopic testis (testis found outside its normal path of descent) is most commonly located within a superficial pouch between the external oblique fascia and Scarpa's fascia (Denis Browne pouch)
- differential diagnosis:
 - retractile testes
 - atrophic testes
 - disorders of sexual differentiation (bilateral impalpable gonads)

Epidemiology

- 2.7% of full term newborns
- 0.7-0.8% at 1 yr

Treatment

- orchiopexy
- hormonal therapy not proven to be of benefit over standard surgical treatment

Prognosis

- reduction in fertility
 - untreated bilateral cryptorchidism: ~100% infertility
 - paternity rates: 53%, 90%, and 93% in formerly bilateral cryptorchid, formerly unilateral cryptorchid, and normal men, respectively
- increased malignancy risk
 - intraabdominal > inguinal
 - surgical correction facilitates testicular monitoring and may reduce malignancy risk
- increased risk of testicular torsion (reduced by surgical correction)

Normal Testicular Development and Descent *in Utero*

2nd month: Testicle begins to form

4th month: Begins to take on its normal appearance and migrates from its origin at the kidney to the internal inguinal ring

7th month: The testis, surrounded in peritoneal covering, begins to descend through the internal ring, inguinal canal and external ring to terminate in the scrotum

Disorders of Sexual Differentiation

Definition

- formerly known as intersex disorders
- abnormal genitalia for chromosomal sex due to the undermasculinization of males or the virilization of females
- considered a social emergency

Classification

1. 46 XY DSD
 - defect in testicular synthesis of androgens
 - androgen resistance in target tissues
 - palpable gonad
2. 46 XX DSD
 - most due to CAH (21-hydroxylase deficiency most common enzymatic defect) → shunt in steroid biosynthetic pathway leading to excess androgens
 - undiagnosed and untreated CAH can be associated with life-threatening electrolyte abnormalities in the newborn (salt-wasting CAH)
3. ovotesticular DSD
4. mixed gonadal dysgenesis (46 XY/45 XO most common karyotype)
 - presence of Y chromosome → partial testis determination to varying degrees

A phenotypic male newborn with bilateral non-palpable testicles should be considered 46XX with salt-wasting CAH and must undergo proper evaluation prior to discharge

Diagnosis

- thorough family Hx noting any consanguinity
- maternal Hx, especially medication/drug use during pregnancy (maternal hyperandrogenemia)
- P/E: palpable gonad (= chromosomal male), hyperpigmentation, evidence of dehydration, HTN, stretched phallus length, position of urethral meatus
- laboratory tests
 - plasma 17-OH-progesterone (after 36 h of life) → increased in 21-hydroxylase deficiency (CAH)
 - plasma 11-deoxycortisol → increased in 11-β-hydroxylase deficiency
 - basal adrenal steroid levels
 - serum testosterone and DHT pre- and post-hCG stimulation (2,000 IU/d for 4 d)
 - serum electrolytes
 - chromosomal evaluation including sex karyotype
- U/S of adrenals, gonads, uterus, and fallopian tubes
- endoscopy and genitography of urogenital sinus

Treatment

- steroid supplementation as indicated (e.g. CAH)
- sex assignment after extensive family consultation
 - must consider capacity for sexually functioning genitalia in adulthood, fertility potential, and psychological impact
- reconstruction of external genitalia between 6 and 12 mo
- long-term psychological guidance and support for both patient and family

Enuresis

- see [Pediatrics](#), P9

Selected Urological Procedures

Bladder Catheterization

- catheter size measured by the French (Fr) scale – circumference in mm
- each 1 mm increase in diameter = approximately 3 Fr increase (standard size 16-18 Fr)
- should be removed as soon as possible to reduce the risk of UTI

Continuous Catheterization

- indications
 - accurate monitoring of U/O
 - relief of urinary retention due to medication, neurogenic bladder, or intravesical obstruction
 - temporary therapy for urinary incontinence
 - perineal wounds
 - clot prevention (24-28 Fr) for CBI
 - post-operative

Alternatives to Continuous Catheterization

- intermittent catheterization
 - PVR measurement
 - to obtain sterile diagnostic specimens for U/A, urine C&S
 - management of neurogenic bladder or chronic urinary retention
- condom catheter
- suprapubic catheter

Causes of Difficult Catheterizations and Treatment

- patient discomfort → use sufficient lubrication (± xylocaine)
- collapsing catheter → lubrication as above ± firmer or larger catheter (silastic catheter)
- meatal/urethral stricture → dilate with progressively larger catheters/balloon catheter
- BPH → use coude catheter as angled tip can help navigate around enlarged prostate
- urethral disruption/obstruction → filiform and followers or suprapubic catheterization
- anxious patient → anxiolytic medication

Complications of Catheterization

- infection: UTI
- meatal/urethral trauma

Figure 18. Transurethral (Foley) catheters

Contraindications

- urethral trauma: blood at the meatus of the urethra, scrotal hematoma, pelvic fracture, and/or high riding prostate

Circumcision

Definition

- removal of some or all of the foreskin from the penis

Epidemiology

- 30% worldwide
- frequency varies depending on geographic location, religious affiliation, socioeconomic classification

Medical Indications

- phimosis and recurrent paraphimosis
- recurrent UTIs (particularly in infants and in association with other urinary abnormalities)
- balanitis xerotica obliterans or other chronic inflammatory conditions

Contraindications

- unstable or sick infant
- congenital genital abnormalities (hypospadias)
- family Hx of bleeding disorders warrants laboratory investigation prior to circumcision

Complications

- bleeding
- infection
- penile entrapment, skin bridges
- fistula
- glans injury
- penile sensation deficits

Cystoscopy

Objective

- endoscopic inspection of the lower urinary tract (urethra, prostate, bladder, and ureteral orifices), samples for cytology
- scopes can be flexible or rigid

Indications

- gross hematuria
- LUTS (storage or voiding)
- urethral and bladder neck strictures
- bladder stones
- bladder tumour surveillance
- evaluation of upper tracts with retrograde pyelography (ureteric stents, catheters)

Complications

- during procedure
 - bleeding
 - anesthetic-related
 - perforation (rare)
- post-procedure (short-term)
 - infections, e.g. epididymo-orchitis (rare)
 - urinary retention
- post-procedure (long-term)
 - stricture

Male Circumcision for Prevention of Heterosexual Acquisition of HIV in Men

Cochrane DB Syst Rev 2009;2:CD003362

Purpose: To evaluate the effectiveness and safety of male circumcision for preventing acquisition of HIV in heterosexual men.

Methods: The analyzed data is from three randomized controlled trials to assess the efficacy of male circumcision for preventing HIV acquisition in men in Africa.

Results: Medical male circumcision reduces the acquisition of HIV by heterosexual men (38%-66% over 24 mo).

Circumcision Status and Risk of HIV and Sexually Transmitted Infections among Men who have Sex with Men: A Meta-Analysis

JAMA 2008;300:1674-1684

Purpose: To describe the association between male circumcision and HIV infection and other sexually transmitted infections (STIs) among men who have sex with men (MSM).

Methods: Meta-analysis of 15 studies (n=53,567)

Results: The associations between circumcision and HIV-positive and STIs were not statistically significant. Male circumcision had a protective association with HIV in studies of MSM conducted before the introduction of highly active anti-retroviral therapy.

Conclusions: There is insufficient evidence to support that male circumcision protects against HIV infection or other STIs.

Male Circumcision

Pediatrics 2012;130:e756-e785

Study: Guidelines by the American Academy of Pediatrics (AAP).

Recommendations: The American Academy of Pediatrics radically changed their position on male circumcision in 2012. The report from the AAP now states that the preventative health benefits outweigh the risks of the procedure and that the procedure is well-tolerated with adequate pain management and sterility. Stated benefits include the prevention of urinary tract infection, penile cancer, transmission of some sexually transmitted infections, including HIV. There is believed to be no effect on penile sexual function, sensitivity or sexual satisfaction. Acute complications are rare and more common if the procedure is done by an untrained provider.

Note: The Canadian Pediatric Society (CPS) has not yet updated their position on male circumcision since 1996, which stated that the CPS is opposed to routine circumcision. A new statement is expected soon.

Radical Prostatectomy

Objective

- the removal of the entire prostate and prostatic capsule via a lower midline abdominal incision, laparoscopically or robotically
 - internal iliac and obturator vessel lymph nodes may also be dissected and sent for pathology (dependent on risk: clinical stage, grade, PSA)
 - seminal vesicle vessels are also partially or completely removed

Indications

- treatment for localized prostate cancer

Complications

- immediate (intraoperative)
 - blood loss
 - rectal injury (extremely rare)
 - ureteral injury (extremely rare)
- perioperative
 - lymphocele formation
- late
 - moderate to severe urinary incontinence (3-10%)
 - mild urinary incontinence (20%)
 - ED (~50%, depending on whether one, both, or neither of the neurovascular bundles are involved in extracapsular extension of tumour)

Retropubic, Laparoscopic, and Robot-Assisted Radical Prostatectomy: A Critical Review of Outcomes Reported by High-Volume Centres

J Endourology 2010;24:2003-2015

Study: A systematic review to compare perioperative outcomes, positive surgical margin (PSM) rates, and functional outcomes in retropubic radical prostatectomy (RRP) laparoscopic RP (LRP) and robot-assisted radical prostatectomy (RARP).
Methods: Medline database was searched. Weighted means (based on number of participants in each study) were calculated for all outcomes.

Results: 58 articles were reviewed. LRP and RARP were associated with better perioperative outcomes compared to RRP. RRP, LRP, and RARP had similar post-operative complication rates ranging from 10.3-10.98%. RARP had a lower overall PSM rate than LRP, and RRP. RARP had the highest continence rate and mean potency rates.

Conclusion: In high-volume centers, RRP, LRP and RARP are safe options for treating patients with localized prostate cancer. LRP and RARP are associated with better perioperative outcomes and RARP showed lower PSM rates, higher potency and continence compared to RRP and LRP.

Transurethral Resection of the Prostate

Objective

- to partially resect the periurethral portion of the prostate (transition zone) to decrease symptoms of urinary tract obstruction
- accomplished via a transurethral (cystoscopic) approach using an electrocautery loop, irrigation (glycine), and illumination

Indications

- obstructive uropathy (large bladder diverticula, renal insufficiency)
- refractory urinary retention
- recurrent UTIs
- recurrent gross hematuria
- bladder stones
- intolerance/failure of medical therapy

Complications

- acute
 - intra- or extraperitoneal rupture of the bladder
 - rectal perforation
 - incontinence
 - incision of the ureteral orifice (with subsequent reflux or ureteral stricture)
 - hemorrhage
 - epididymitis
 - sepsis
 - transurethral resection syndrome (also called "post-TURP syndrome")
 - caused by absorption of a large volume of the hypotonic irrigation solution used, usually through perforated venous sinusoids, leading to a hypervolemic hyponatremic state
 - characterized by dilutional hyponatremia, confusion, nausea, vomiting, HTN, bradycardia, visual disturbances, CHF, and pulmonary edema
 - treat with diuresis and (if severe) hypertonic saline administration
- chronic
 - retrograde ejaculation (>75%)
 - ED (5-10% risk increases with increasing use of cautery)
 - incontinence (<1%)
 - urethral stricture
 - bladder neck contracture

Extracorporeal Shock Wave Lithotripsy

Objective

- to treat renal and ureteral calculi (proximal, middle or distal) which cannot pass through the urinary tract naturally
- shockwaves are generated and focused onto stone → fragmentation, allowing stone fragments to pass spontaneously and less painfully

Indications

- potential first-line therapy for renal and ureteral calculi <2.5 cm
 - individuals with calculi in solitary kidney
 - individuals with HTN, DM or renal insufficiency
- *patient preference and wait-times play a large role in stone management

Contraindications

- acute UTI or urosepsis
- bleeding disorder or coagulopathy
- pregnancy
- obstruction distal to stone

Complications

- bacteriuria
- bacteremia
- post-procedure hematuria
- ureteric obstruction (by stone fragments)
- peri-nephric hematoma

A Comparison of Treatment Modalities for Renal Calculi Between 100 and 300 mm²: Are Shockwave Lithotripsy, Ureteroscopy, and Percutaneous Nephrolithotomy Equivalent?
J Endourol 2011;25:481-485

Purpose: To describe the outcomes of a series of patients who underwent shockwave lithotripsy (SWL), ureteroscopy (URS) or percutaneous nephrolithotomy (PCNL).

Methods: Patients treated for intermediate-sized upper tract calculi (100-300 mm²) at a single tertiary centre were included. Demographic and clinical data were collected from a prospectively maintained database.

Results: Of 137 patients, 38.7%, 29.9%, and 31.4% were treated with SWL, URS, and PCNL, respectively. Stone-free rate (95.3%) and single treatment success rate (95.3%) were highest for PCNL compared to SWL and URS ($p < 0.001$). When allowing for up to two SWL treatments, success rates became equivalent for the three treatment groups ($p = 0.66$). Auxiliary treatments were more frequent after SWL compared to URS and PCNL. Clavien grade complications did not differ between the three groups.

Conclusion: Up to two SWL treatments have equivalent success rate as compared to URS and PCNL. Hence, multiple SWL treatments may be a reasonable therapeutic option for patients who prefer SWL or who are not good candidates for alternative therapies.

Common Medications

Table 27. Erectile Dysfunction Medications

Drug	Class	Mechanism	Adverse Effects
sildenafil tadalafil vardenafil (PDE5s for use when some erection present)	Phosphodiesterase 5 inhibitor	Selective inhibition of PDE5 (enzyme which degrades cGMP) Leads to sinusoidal smooth muscle relaxation and erection	Severe hypotension (very rare) Contraindicated if Hx of priapism, or in conditions predisposing to priapism (leukemia, myelofibrosis, polycythemia, sickle cell disease) Contraindicated with nitrates
alprostadil (MUSE®), PGE ₁ + phentolamine + papaverine mixture	Prostaglandin E ₁	Activation of cAMP, relaxing sinusoidal smooth muscle Local release (capsule inserted into urethra)	Penile pain Presyncope
alprostadil, papaverine (intracavernosal injection)	See above	See above	Thickening of tunica albuginea at site of repeated injections (Peyronie's plaque) Painful erection Hematoma Contraindicated if Hx of priapism, or in conditions predisposing to priapism
triple therapy also used: papaverine, phentolamine, PGE ₁			

Table 28. Benign Prostatic Hyperplasia Medications

Drug	Class	Mechanism	Adverse Effects
terazosin doxazosin	α ₁ blockers	α-adrenergic antagonists reduce stromal smooth muscle tone Reduce dynamic component of bladder outlet obstruction	Presyncope Leg edema Retrograde ejaculation
tamsulosin alfuzosin silodosin	α _{1A} selective		Headache Asthenia Nasal congestion
finasteride dutasteride	5-α reductase inhibitor	Blocks conversion of testosterone to DHT Reduces static component of bladder outlet obstruction Reduces prostatic volume	Sexual dysfunction PSA decreases

Table 29. Prostatic Carcinoma Medications (N>0, M>0)

Drug	Class	Mechanism	Adverse Effects
leuprolide, goserelin	GnRH agonist	Initially stimulates LH, increasing testosterone and causing "flare" (initially increases bone pain) Later causes low testosterone	Hot flashes Headache Decreased libido
*diethylstilbestrol (DES)	Estrogens	Inhibit LH and cytotoxic effect on tumour cells	Increased risk of cardiovascular events (no longer available commercially in North America)
*cyproterone acetate	Steroidal antiandrogen	Competes with DHT for intracellular receptors: 1. Prevent flare produced by GnRH agonist 2. Use for complete androgen blockade 3. May preserve potency	
flutamide, bicalutamide	Non-steroidal antiandrogen	As above	Hepatotoxic: AST/ALT monitoring
*ketoconazole, spironolactone	Steroidogenesis inhibitors	Blocks multiple enzymes in steroid pathway, including adrenal androgens	GI symptoms Hyperkalemia Gynecomastia

*Very rarely used

Table 30. Continence Agents and Overactive Bladder Medications

Drug	Class	Mechanism	Indication	Adverse Effects
oxybutynin	Antispasmodic	Inhibits action of ACh on smooth muscle Decreases frequency of uninhibited detrusor contraction Diminishes initial urge to void	Overactive bladder Urge incontinence + urgency + frequency	Dry mouth Blurred vision Constipation Supraventricular tachycardia
oxybutynin, tolterodine, trospium, solifenacin, darifenacin, fesoterodine	Anticholinergic	Muscarinic receptor antagonist Selective for bladder Increases bladder volume Decreases detrusor pressure	Overactive bladder Urge incontinence + urgency + frequency	As above
mirabegron	β3 agonist	Beta sympathetic receptor blocker in the bladder; relaxes bladder during storage phase	Overactive bladder Urge incontinence + urgency + frequency	Blood pressure should be monitored
imipramine	Tricyclic antidepressant	Sympathomimetic effects: urinary sphincter contraction Anticholinergic effects: detrusor relaxation	Stress and urge incontinence	As above Weight gain Orthostatic hypotension Prolonged PR interval

Note: All anti-cholinergics are equally effective and long-acting formulations are better tolerated. Newer muscarinic M3 receptor specific agents (solifenacin, darifenacin) are equally efficacious as older drugs, however, RCTs based on head-to-head comparison to long acting formulations are lacking.

Acronyms

AAA	abdominal aortic aneurysm	CVI	chronic venous insufficiency	MCA	middle cerebral artery
ABI	ankle-brachial index	CXR	chest x-ray	MRA	magnetic resonance angiography
ACEI	angiotensin converting enzyme inhibitor	DIC	disseminated intravascular coagulation	MSK	musculoskeletal
AFib	atrial fibrillation	DM	diabetes mellitus	OCP	oral contraceptive pill
AKA	above-knee amputation	DVT	deep vein thrombosis	PE	pulmonary embolism
AKI	acute kidney injury	ECASA	enteric coated ASA	PT	prothrombin time
aPTT	activated partial thromboplastin time (i.e. PTT)	ECG	electrocardiogram	PTT	partial thromboplastin time (i.e. aPTT)
ASA	acetylsalicylic acid (Aspirin®)	Echo	echocardiogram	PVD	peripheral vascular disease
AT	anterior tibial artery	ET	essential thrombocythemia	RIND	reversible ischemic neurologic deficit
BKA	below-knee amputation	EVAR	endovascular aortic aneurysm repair	SFA	superficial femoral artery
BP	blood pressure	EVLV	endovenous laser therapy	SVA	superficial venous thrombosis
CABG	coronary artery bypass graft	GSV	greater saphenous vein	TAA	thoracic aortic aneurysm
CAD	coronary artery disease	HITT	heparin-induced thrombocytopenia with thrombosis	TEE	transesophageal echocardiography
CBC	complete blood count	HTN	hypertension	TEVAR	thoracic endovascular aortic aneurysm repair
CCB	calcium channel blocker	IBD	inflammatory bowel disease	TIA	transient ischemic attack
CLI	critical limb ischemia	INR	international normalized ratio	TTE	transthoracic echocardiography
CTA	computed tomography angiography	LMWH	low molecular weight heparin		
CVD	cerebrovascular disease	LSV	lesser saphenous vein		

Peripheral Arterial Disease

Chronic Arterial Occlusion/Insufficiency

Figure 1. Peripheral vascular anatomy

Definition

- chronic ischemia due to inability of the arterial supply to meet cellular metabolic demands

Etiology

- predominantly due to atherosclerosis (for pathogenesis, see [Cardiology](#), C26); primarily occurs in the lower extremities

Risk Factors

- major: smoking, DM
- minor: HTN, hyperlipidemia, obesity, sedentary lifestyle, PMHx or FMHx CAD/CVD

Clinical Features

- claudication - must differentiate vascular from neurogenic claudication (see Table 1)
 1. pain with exertion: usually in calves or any exercising muscle group
 2. relieved by short rest: 2-5 min, and no postural changes necessary
 3. reproducible: same distance to elicit pain, same location of pain, same amount of rest to relieve pain
- critical limb ischemia (CLI)
 1. includes rest pain, night pain, tissue loss (ulceration or gangrene)
 2. pain most commonly over the forefoot, waking person from sleep, and often relieved by hanging foot off bed
 3. ankle pressure <40 mmHg, toe pressure <30 mmHg, ABI <0.40
- pulses may be absent at some locations, bruits may be present
- signs of poor perfusion: hair loss, hypertrophic nails, atrophic muscle, skin ulcerations and infections, slow capillary refill, prolonged pallor with elevation and rubor on dependency, venous troughing (collapse of superficial veins of foot)
- other manifestations of atherosclerosis

Differential Diagnosis of Claudication

Vascular

- Atherosclerotic disease
- Vasculitis (e.g. Buerger's disease, Takayasu's arteritis)
- Diabetic neuropathy
- Venous disease (e.g. DVT, varicose veins)
- Popliteal entrapment syndrome (e.g. Baker's cyst, tumour)

Neurogenic

- Neurospinal disease (e.g. spinal stenosis)
- Reflex sympathetic dystrophy

MSK

- OA
- Rheumatoid arthritis/connective tissue disease
- Remote trauma

Table 1. Clinical Categories of Acute Limb Ischemia

	Vascular Claudication	Neurogenic Claudication
Palliating Factors	Stop walking	Bending over/sitting
Provoking Factors	Walking uphill	Walking downhill
Pulses/ABIs	Reduced	Normal
Pain on Bicycling	Present	Absent
Motor Weakness after Walking	Absent	Present
Skin Changes	Present	Absent

Investigations

- non-invasive
 - routine blood work, fasting metabolic profile
 - ABI: take highest brachial and highest ankle (dorsalis pedis artery or posterior tibial artery) pressures for each side generally
 - ABI <0.90 abnormal, rest pain appears at <0.30 (see Table 3)
 - CTA and MRA
 - excellent for large arteries (aorta, iliac, femoral, popliteal)
 - may have difficulty with tibial arteries (especially in the presence of disease)
 - require IV injection of nephrotoxic contrast (iodinated contrast for CT, gadolinium for MR)
 - used primarily for planning interventions
- invasive
 - arteriography: superior resolution to CTA/MRA, better for tibial arteries, can be done intraoperatively

Table 2. Ankle-Brachial Indices

ABI Recording	Degree of Ischemia
>1.20	Suspect wall calcification (most common in diabetics)
>0.95	Normal/no ischemia
0.50-0.80	Claudication range
<0.40	Possible critical ischemia

Treatment

- conservative
 - risk factor modification (smoking cessation, HbA1c control, treatment of HTN, hyperlipidemia (statin), antiplatelet therapy [ECASA])
 - exercise program (30 min 3x/wk): improves collateral circulation, oxygen extraction at the muscle level
 - foot care (especially in DM): keep wounds clean/dry, avoid trauma and pressure on wounds
- pharmacotherapy
 - antiplatelet agents (e.g. ECASA, clopidogrel)
 - cilostazol (cAMP-phosphodiesterase inhibitor with antiplatelet and vasodilatory effects): improves walking distance for some patients with claudication (not available in Canada)
- surgical/endovascular
 - indications: severe lifestyle impairment, vocational impairment, critical ischemia
 - surgical options
 - ♦ endovascular (stenting/angioplasty)
 - ♦ endarterectomy: removal of plaque and repair with patch (usually distal aorta or common/profunda femoral)
 - ♦ bypass graft sites: aortofemoral, axillofemoral, femoropopliteal, distal arterial – graft choices: vein graft (reversed or *in situ*), synthetic (polytetrafluoroethylene graft (e.g. Gore-Tex®) or Dacron®)
 - ♦ amputation: if not suitable for revascularization, persistent serious infections/gangrene

Prognosis

- claudication: conservative therapy: 60-80% improve, 20-30% stay the same, 5-10% deteriorate, 5% will require intervention within 5 yr, <4% will require amputation
- for patients with CLI (rest pain, night pain, ulceration or gangrene): high risk of limb loss (which carries 25% risk of death at 1 yr)

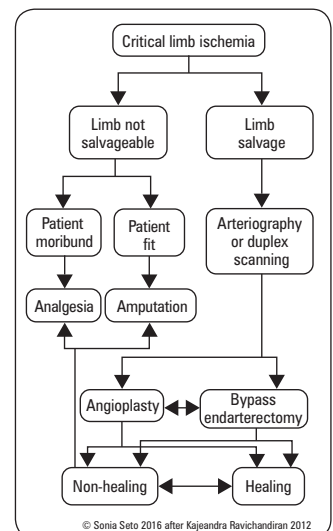

Figure 2. Treatment options for CLI
Modified from Beard JD. Chronic lower limb ischemia. *BMJ* 2000;320:854-857

Hypercoagulable State

Congenital

- Group I (reduced anticoagulants)
 - Antithrombin
 - Protein C
 - Protein S
- Group II (increased coagulants)
 - Factor V Leiden
 - Prothrombin
 - Factor VIII
 - Hyper-homocysteinemia

Acquired

- Immobility
- Cancer
- Pregnancy/Systemic hormonal contraceptives/HRT
- Antiphospholipid antibody syndrome
- Inflammatory disorders (e.g. IBD)
- Myeloproliferative disorders (e.g. ET)
- Nephrotic syndrome (acquired deficit in Protein C and S)
- DIC
- HIT

Acute Arterial Occlusion/Insufficiency

Definition

- acute occlusion/rupture of a peripheral artery, usually without a history of claudication
- urgent management required
 - skeletal muscle can tolerate 6 h of ischemia before or irreversible damage and myonecrosis result; exception is in acute-on-chronic occlusion, because the buildup of collaterals allows time to investigate
- tends to be lower extremity > upper extremity; femoropopliteal > aortoiliac

Etiology and Risk Factors

- embolism (examples of pro-embolic conditions are cardiac arrhythmias, endocarditis, and arterial aneurysms)
- existing atherosclerotic plaques (ie chronic PAD) can rupture causing occlusion
- hypercoagulable states can contribute to arterial thrombosis

Clinical Features

Table 3. Arterial Embolism vs. Thrombosis

Presentation	Embolus	Thrombus
Onset	Acute	Progressive, acute-on-chronic
Loss of Function/Sensation	Prominent	Less profound (due to underlying collaterals)
Hx of Claudication	No	Maybe
Atrophic Changes	No	Maybe
Contralateral Limb Pulses	Classically normal	Decreased or absent

Investigations

- history and physical exam are essential: depending on degree of ischemia one may have to forego investigations and go straight to the operating room
- ABI: extension of physical exam, easily performed at bedside
- ECG, troponin: rule out recent MI or arrhythmia
- CBC: rule out leukocytosis, thrombocytosis or recent drop in platelets in patients receiving heparin
- PT/INR: patient anticoagulated/sub-therapeutic INR
- Echo: identify wall motion abnormalities, intracardiac thrombus, valvular disease, aortic dissection (Type A)
- CT angiogram: underlying atherosclerosis, aneurysm, aortic dissection
- conventional catheter based angiography: can be obtained in OR; prelude to thrombolytics

Table 4. Clinical Categories of Acute Limb Ischemia

Grade	Category	Sensory Loss	Motor Deficit	Prognosis
I	Viable	None	None	No immediate threat
IIA	Marginally threatened	None or minimal (toes)	None	Salvageable if promptly treated
IIB	Immediately threatened	More than toes	Mild/moderate	Salvageable if promptly revascularized
III	Irreversible	Profound, anesthetic	Profound, paralysis (rigor)	Major tissue loss Amputation Permanent nerve damage inevitable

Treatment

- immediate heparinization with 5000 IU bolus and continuous infusion to maintain PTT >60 s
- if impaired neurovascular status: emergent revascularization
- if intact neurovascular status: time for work up (including angiogram)
- definitive treatment
 - embolus: embolectomy
 - thrombus: thrombectomy ± bypass graft ± endovascular therapy
 - irreversible ischemia (complete loss of power or sensation, absent venous and arterial dopplers, rigor): primary amputation
- identify and treat underlying cause
- continue heparin post-operatively; start warfarin post-operative day 1 x 3 mo depending on underlying etiology

Complications

- compartment syndrome with prolonged ischemia; requires 4-compartment (anterior/lateral/superficial and deep posterior) fasciotomy
- risk of arrhythmia and death with reperfusion injury
- renal failure and multi-organ failure due to toxic metabolites from ischemic muscle

Prognosis

- 12-15% mortality rate
- 5-40% morbidity rate (amputation)

Symptoms of Acute Limb Ischemia

6 Ps – all may not be present

Pain: absent in 20% of cases

Pallor: within a few hours becomes mottled cyanosis

Paresthesia: light touch lost first then sensory modalities

Paralysis/Power loss: most important, heralds impending gangrene

Polar/Poikilothermia (cold)

Pulselessness: not reliable

Aortic Disease

Aortic Dissection

Definition

- tear in aortic intima allowing blood to dissect into the media
- Stanford classification: Type A (involve the ascending aorta) vs. Type B (do not)
- DeBakey Classification
 - Type I: involves the ascending aorta, aortic arch, and descending aorta
 - Type II: confined to the ascending aorta
 - Type III: confined to the descending aorta distal to the left subclavian artery
- acute <2 wk (initial mortality 1% per hour for Type A dissections)
- chronic >2 wk (mortality levels up to 75-80%)

Etiology

- most common: HTN → degenerative/cystic changes → damage to aortic media
- other: connective tissue disease (e.g. Marfan's, Ehlers-Danlos), cystic medial necrosis, atherosclerosis, congenital conditions (e.g. coarctation of aorta, bicuspid aortic valves, patent ductus arteriosus), infection (e.g. syphilis), trauma, arteritis (e.g. Takayasu's)

Epidemiology

- incidence of 5.2 in 1,000,000
- M:F = 3.2:1
- small increased incidence in African-Canadians (related to higher incidence of HTN)
- lowest incidence in Asians
- peak incidence 50-65 yr old; 20-40 yr old with connective tissue diseases

Clinical Features

- sudden onset tearing chest pain that radiates to back with:
 - HTN (75-85% of patients)
 - asymmetric BPs and pulses between arms (>30 mmHg difference indicates poor prognosis)
 - ischemic syndromes due to occlusion of aortic branches: coronary (MI), carotids (ischemic stroke, Horner's syndrome), splanchnic (mesenteric ischemia), renal (AKI), peripheral (ischemic leg), intercostal vessels (spinal cord ischemia)
 - "unseating" of aortic valve cusps (new diastolic murmur in 20-30%) in Type A dissection
 - rupture into pleura (dyspnea, hemoptysis) or peritoneum (hypotension, shock) or pericardium (cardiac tamponade)
 - syncope

Investigations

- CXR
 - pleural cap (pleural effusion in lung apices)
 - widened mediastinum
 - left pleural effusion with extravasation of blood
- TEE: can visualize aortic valve and thoracic aorta but not abdominal aorta
- ECG: LVH ± ischemic changes, pericarditis, heart block
- CTA (gold standard), aortography, MRA: 100% sensitive and specific
- blood work: lactate (elevated in ischemic gut, shock), amylase (rule out pancreatitis), troponin (rule out MI)

Treatment

- pharmacologic
 - β-blocker to lower BP and decrease cardiac contractility
 - use nondihydropyridine CCB if there is a clear contraindication to β-blockers
 - target sBP of 110 mmHg and HR <60 bpm
 - ACEI and/or other vasodilators if insufficient BP or HR control
- surgical
 - urgent surgical consult if thoracic aortic dissection diagnosed or highly suspected
 - Type A to cardiac surgery, Type B to vascular surgery
 - resection of segment with intimal tear
 - reconstitution of flow through true lumen
 - replacement of the affected aorta with prosthetic graft
 - correction of any predisposing factors
 - post-operative complications: renal failure, intestinal ischemia, stroke, paraplegia, persistent leg ischemia, death
 - 2/3 of patients die of operative or post-operative complications

Figure 3. Aortic anatomy

- Type A: requires emergent surgery with cardiopulmonary bypass;
 - ♦ may require
 - hypothermic circulation for transverse arch dissections
 - resuspension of aortic valve
 - aortic valve replacement
 - coronary re-implantation for aortic root involvement
 - ♦ initial mortality rate without surgery is 3% per h for first 24 h, 30% 1 wk, 80% 2 wk
- Type B: managed medically in absence of spinal/mesenteric/limb malperfusion syndrome
 - ♦ <10-20% require urgent operation for complications
 - ♦ treatment can be surgical or endovascular
 - ♦ require follow-up over time to monitor for aneurysmal degeneration
 - ♦ role for early endovascular intervention controversial (2013 INSTEAD trial)
- with treatment, 60% 5 yr survival, 40% 10 yr survival

Does This Patient have an Acute Thoracic Aortic Dissection

Aortic Aneurysm

Definition of Aneurysm

- localized dilatation of an artery having a diameter at least 1.5x that of the expected normal diameter
 - true aneurysm: involving all vessel wall layers (intima, media, adventitia)
 - false aneurysm (also known as pseudo-aneurysm): disruption of the aortic wall or the anastomotic site between vessel and graft with containment of blood by a fibrous capsule made of surrounding tissue
- aneurysms can rupture, thrombose, embolize, erode, and fistulize

Classification

- thoracic aortic aneurysm (TAA): ascending, transverse arch, descending
- thoracoabdominal
- abdominal aortic aneurysm (AAA): 90-98% are infrarenal
 - suprarenal: involves one or more visceral arteries, but does not involve the chest
 - pararenal: renal arteries arise from aneurysmal aorta, but the SMA origin is not aneurysmal
 - juxtarenal: the renal arteries originate from normal aorta, but are immediately adjacent to aneurysmal aorta (there is no nonaneurysmal aorta distal to the origin of the renal arteries)
 - infrarenal: The aneurysm originages distal to the renal arteries (there is nonaneurysmal aorta distal to the origins of the renal arteries)

Etiology

- degenerative (atherosclerotic)
- traumatic
- mycotic (*Salmonella*, *Staphylococcus*, usually suprarenal aneurysms)
- connective tissue disorder (Marfan syndrome, Ehlers-Danlos syndrome)
- vasculitis
- infectious (syphilis, fungal)
- ascending thoracic aneurysms are associated with bicuspid aortic valve
- risk factors: smoking, HTN, age >70, family history

Epidemiology

- incidence 4.7 to 31.9 per 100,000 for AAA and 5.9 per 100,000 for TAA
- high risk groups
 - ≥65 yr
 - M:F = 3.8:1
 - PVD, CAD, CVD
 - family history of AAA

Figure 5. Classification of aneurysms

Figure 4. Classification of aortic dissection (black arrow indicates where the dissection begins)

ACC/AHA 2005 Guidelines define an AAA when the minimum AP diameter of abdominal aorta ≥3.0 cm

Clinical Features

- associated diseases: HTN, PVD, CAD, COPD, renal insufficiency
- most commonly in the abdominal aorta (50% abdominal aorta, 40% thoracic aorta, 10% ascending aorta)
- common presentation: due to acute expansion or rupture
 - syncope
 - pain (chest, abdominal, flank, back)
 - hypotension
 - palpable pulsatile mass above the umbilicus
 - airway or esophageal obstruction, hoarseness (left recurrent laryngeal nerve paralysis), hemoptysis, or hematemesis (indicates thoracic or thoracoabdominal aortic aneurysm)
 - distal pulses may be intact
- 75% asymptomatic (discovered incidentally)
- uncommon presentations
 - ureteric obstruction and hydronephrosis (often with inflammatory aortic aneurysm)
 - gastrointestinal bleed (duodenal mucosal hemorrhage, aortoduodenal fistula)
 - ♦ aortocaval fistula
 - distal embolization (blue toe syndrome) occurs in <1% of AAAs

Investigations

- blood work: CBC, electrolytes, urea, creatinine, PTT, INR, type and cross
- abdominal U/S (100% sensitive, up to ± 0.6 cm accuracy in size determination)
- CT with contrast (accurate visualization, size determination, EVAR planning)
- aortogram (only for EVAR)
- Doppler/duplex (rule out vascular tree aneurysms elsewhere, e.g. popliteal)

Treatment

- conservative (for aneurysms that do not meet the size threshold for repair)
 - cardiovascular risk factor reduction: smoking cessation; control of HTN, DM, and hyperlipidemia
 - regular exercise
 - watchful waiting, U/S every 6 mo to 3 yr depending on size and location
- surgical
 - when risk of rupture greater than or equal to risk of surgery (>5.5 cm for AAA)
 - risk of rupture depends on
 - ♦ size
 - ♦ family history of rupture
 - ♦ rate of enlargement (>1cm diameter expansion per yr defines "rapid expander")
 - ♦ symptoms, comorbidities (HTN, COPD, dissection), smoking
 - elective AAA repair mortality 2-5% for open repair (1-2% for EVAR); elective TAA repair mortality <10% (highest with proximal aortic and thoracoabdominal repairs)
 - consider revascularization for patients with symptomatic or 3-vessel CAD before elective repair of aneurysm
 - indications
 - ♦ ruptured
 - ♦ symptomatic
 - ♦ prophylaxis when risk of rupture is greater than risk of surgery (size >5.5 cm for AAA)
 - ♦ ascending thoracic aortic aneurysms
 - symptomatic, enlarging, diameter >6 cm or >2x normal lumen size, >4.5 cm and aortic regurgitation (annuloaortic ectasia); ≥ 4.5 -5 cm in Marfan syndrome
 - contraindications: life expectancy <1 yr, terminal disease (e.g. cancer), significant comorbidities (e.g. recent MI, unstable angina), severe dementia, advanced age
 - surgical options
 - ♦ open surgery (laparotomy or retroperitoneal) with graft replacement
 - possible complications
 - early: renal failure, spinal cord injury (paraparesis or paraplegia), impotence, arterial thrombosis, anastomotic rupture or bleeding, peripheral emboli
 - late: graft infection/thrombosis, aortoenteric fistula, anastomotic (pseudo) aneurysm
 - ♦ endovascular aneurysm repair (EVAR)
 - newer procedure; high success rates in patients with suitable anatomy and experienced centres
 - advantages: preferred to open surgery in ruptured AAA for patients with suitable anatomy, decreased morbidity and mortality, procedure time, need for transfusion, ICU admissions, length of hospitalization, and recovery time
 - disadvantages: endoleak rates as high as 20-30%, device failure increasing as longer follow-up periods are achieved, re-intervention rates 10-30%, cost-effectiveness is an issue (devices are very expensive), radiation exposure
 - complications
 - early: immediate conversion to open repair (<1%), groin hematoma, arterial thrombosis, iliac artery rupture, and thromboemboli
 - late: endoleak, severe graft kinking, migration, thrombosis, rupture of aneurysm

CCS PAD Guidelines 2006

Recommend AAA Screening Among:

- Men aged 65-74 yr
- Women aged 65 yr with cardiovascular disease and positive family history of AAA
- Men aged 50 yr and above with a positive family history

CCS PAD Guidelines 2006 Recommend AAA Follow-Up Based on Initial Size

Size	Guideline
<3.0 cm	Repeat ultrasound follow-up in 3-5 yr
3.1-3.4 cm	Repeat ultrasound in 3 yr
3.5-3.9 cm	Repeat ultrasound in 2 yr
4.0-4.5 cm	Repeat ultrasound in 1 yr
≥ 4.5 cm	Referral to vascular surgeon and repeat ultrasound every 6 mo
If >1 cm growth in one yr	Referral to vascular surgeon for consideration of repair

Classic Triad of Ruptured AAA Congenital

- Hypotension/collapse
- Back/abdominal pain
- Palpable, pulsatile abdominal mass

Risk of AAA Rupture

Size (diameter)	1 yr Rupture Risk
<4 cm	0%
4-4.9 cm	1%
5-5.9 cm	5-10%
6-6.9 cm	10-20%
7-7.9 cm	20-40%

Management of Ruptured AAA

- ABCs
- No imaging (hemodynamically unstable)
- Straight to OR (confirm diagnosis by laparotomy)
- Crossmatch 10 units packed RBCs

Endoleak Types

Definition: persistent blood flow into the aneurysm sac

Type I: ineffective seal at ends of graft

Type II: backflow from collateral vessels

Type III: ineffective seal of graft joints or rupture of graft fabric

Type IV: flow through pores of graft fabric

Type V: endotension, with continued expansion of the aneurysm without apparent flow into the sac

Carotid Stenosis

Definition

- narrowing of the internal carotid artery lumen due to atherosclerotic plaque formation, usually near common carotid bifurcation into internal and external carotids

Risk Factors

- for atherosclerosis: HTN, smoking, DM, CVD or CAD, dyslipidemia

Clinical Features

- may be asymptomatic
- symptomatic stenosis may present as TIA, RIND, or stroke
- retinal insufficiency or infarct permanently or temporarily (ipsilateral amaurosis fugax), (see [Ophthalmology](#), OP23)
- MCA contralateral occlusive symptoms

Investigations

- CBC, PTT/INR (hypercoagulable states)
- fundoscopy: cholesterol emboli in retinal vessels (Hollenhorst plaques)
- auscultation over carotid bifurcation for bruits (do not correlate with degree of stenosis)
- carotid duplex: determines severity of disease (mild/moderate/severe stenosis or occlusion)
- angiogram: "gold standard" but invasive and 1/200 risk of stroke (i.e. only used intraoperatively)
- MRA: safer than angiogram, may overestimate stenosis
- CTA

Treatment

- control of HTN, lipids, DM
- antiplatelet agents (ASA \pm dipyridamole, clopidogrel) ~25% relative risk reduction
- carotid endarterectomy (generally if symptomatic and >70% stenosis)
- endovascular angioplasty \pm stenting

Prognosis

Table 5. Symptomatic Carotid Stenosis: North American Symptomatic Carotid Endarterectomy Trial (NASCET)

% Stenosis on Angiogram	Risk of Major Stroke or Death	
	Medical Rx	Medical + Surgical Rx
70-99%	26% over 2 yr	9% over 2 yr
50-69%	22% over 5 yr	16% over 5 yr
<50%	Surgery has no benefit with 5% complication rate	

Table 6. Asymptomatic Carotid Stenosis: Asymptomatic Carotid Atherosclerosis Study (ACAS) and Asymptomatic Carotid Surgery Trial (ACST)

% Stenosis on Angiogram	Risk of Major Stroke or Death	
	Medical Rx	Medical + Surgical Rx
70-99%	26% over 2 yr	9% over 2 yr
60-99%	11% over 5 yr	5.1% over 5 yr (ACAS)
50-69%	11.8% over 5 yr	6.4% over 5 yr (ACST)

Prevention of Disabling and Fatal Strokes by Successful Carotid Endarterectomy in Patients Without Recent Neurological Symptoms: Randomized Controlled Trial

Lancet 2004;363:1491-1502

Study: Asymptomatic Carotid Surgery Trial (ACST), a RCT with follow-up at 5 yr.

Patients: 3,120 asymptomatic patients with significant carotid artery stenosis were randomized equally between immediate carotid endarterectomy (CEA) and indefinite deferral of CEA and were followed for up to 5 yr (mean 3.4 yr).

Main Outcome: Any stroke (including fatal or disabling).

Conclusions: In asymptomatic patients with significant carotid artery stenosis, immediate CEA reduced the net 5-yr stroke risk from about 12% to about 6%. Half of this 5 yr benefit involved disabling or fatal strokes.

Peripheral Venous Disease

Deep Venous Thromboembolism

- see [Hematology](#), H35

Superficial Venous Thrombosis

Definition

- thrombosis of a superficial vein; usually spontaneous but can follow venous cannulation

Etiology

- infectious: suppurative phlebitis (complication of IV cannulation; associated with fever/chills)
- trauma
- inflammatory: varicose veins, migratory superficial thrombophlebitis, Buerger's disease, SLE
- hematologic: polycythemia, thrombocytosis
- neoplastic: occult malignancy (especially pancreatic)
- idiopathic

Clinical Features

- most common in greater saphenous vein and its tributaries
- pain and cord-like swelling along course of involved vein
- areas of induration, erythema, and tenderness correspond to dilated and often thrombosed superficial veins
- complications
 - simultaneous DVT (up to 20% of cases), PE (rare unless DVT)
 - recurrent superficial thrombophlebitis

Migratory superficial thrombophlebitis is often a sign of underlying malignancy ("Trousseau's disease")

Investigations

- non-invasive tests (e.g. Doppler) to exclude associated DVT

Treatment

- conservative
 - moist heat, compression bandages, mild analgesic, anti-inflammatory and anti-platelet (e.g. ASA), LMWH, ambulation
- surgical excision of involved vein
 - indication: failure of conservative measures (symptoms that persist over 2 wk)
 - suppurative thrombophlebitis: broad-spectrum IV antibiotics and excision

Varicose Veins

Definition

- distention of tortuous superficial veins resulting from incompetent valves in the deep, superficial, or perforator systems

Etiology

- primary varicosities: venous valve incompetence or obstruction
 - contributing factors: increasing age, systemic hormonal contraceptive use, prolonged standing, pregnancy, obesity
- secondary varicosities: DVT, malignant pelvic tumours with venous compression, congenital anomalies, arteriovenous fistulae

Epidemiology

- primary varicose veins are the most common form of venous disorder of lower extremity
- 10-20% of population

Clinical Features (Not Correlated with Varicosity Size)

- diffuse aching, fullness/tightness, nocturnal cramping
- aggravated by prolonged standing (end of day), premenstrual
- visible long, dilated and tortuous superficial veins along thigh and leg (greater or short saphenous veins and tributaries)
- ulceration, hyperpigmentation, and induration (secondary varicosities)

- Brodie-Trendelenburg test (valvular competence test)
 - with patient supine, raise leg and compress saphenous vein at thigh, have patient stand – if veins fill quickly from top down then incompetent valves; use multiple tourniquets to localize incompetent veins

Complications

- recurrent superficial thrombophlebitis
- hemorrhage: external or subcutaneous
- ulceration, eczema, lipodermatosclerosis, and hyperpigmentation

Treatment

- largely a cosmetic problem
- conservative: elevation of leg and/or elastic compression stockings
- surgical: high ligation and stripping of the long saphenous vein and its tributaries, ultrasound-guided foam sclerotherapy, endovenous laser therapy
- indications for surgery: symptomatic varix (pain, bleeding, recurrent thrombophlebitis), tissue changes (hyperpigmentation, ulceration), failure of conservative treatment, cosmetics

Prognosis

- benign course with predictable complications
- almost 100% symptomatic relief with treatment if varicosities are primary
- good cosmetic results with treatment
- significant post-operative recurrence

Chronic Venous Insufficiency

Definition

- venous insufficiency and skin damage

Etiology

- calf muscle pump dysfunction and valvular incompetence (valvular reflux) due to phlebitis, varicosities, or DVT
- venous obstruction

Clinical Features

- pain (most common), ankle and calf edema – relieved by foot elevation
- pruritus, brownish hyperpigmentation (hemosiderin deposits)
- stasis dermatitis, subcutaneous fibrosis if chronic (lipodermatosclerosis)
- ulceration: shallow, above medial malleolus, weeping (wet), painless, irregular outline
- signs of DVT/varicose veins/thrombophlebitis

Investigations

- Doppler U/S (most commonly used)
- venography or ambulatory venous pressure measurement (not often used)

Treatment

- conservative
 - elastic compression stockings, ambulation, periodic rest-elevation, avoid prolonged standing
 - ulcers: multilayer compression bandage, antibiotics prn
- endovenous: laser or radiofrequency ablation, or foam sclerotherapy
- surgical
 - if conservative measures fail, or if recurrent/large ulcers
 - surgical ligation of perforators in region of ulcer (GSV/LSV ligation and stripping)

Lymphedema

Definition

- obstruction of lymphatic drainage resulting in edema with high protein content

Etiology

- primary
 - Milroy's syndrome: congenital hereditary lymphedema
 - lymphedema praecox (75% of cases): starts in adolescence
 - lymphedema tarda: starts >35 yr
- secondary
 - infection: filariasis (#1 cause worldwide), post-operative
 - malignant infiltration: axillary, groin or intrapelvic
 - radiation/surgery (axillary, groin lymph node removal): #1 cause in North America

Clinical Features

- classically non-pitting edema
- impaired limb mobility, discomfort/pain, psychological distress

Treatment

- avoid limb injury (can precipitate or worsen lymphedema)
- skin hygiene
 - daily skin care with moisturizers
 - topical treatment of fungal infection; systemic treatment of bacterial infection
- external support
 - intensive: compression bandages
 - maintenance: lymphedema sleeve
- exercise
 - gentle daily exercise of affected limb, gradually increasing ROM
 - must wear a compression sleeve/bandages when doing exercises
- massage and manual lymph drainage therapy

Prognosis

- if left untreated becomes resistant to treatment due to subcutaneous fibrosis
- cellulitis causes rapid increase in swelling: can lead to sepsis and death

Swan Neck Deformity; PL25
Sympathetic Nervous System; CP11
Syndrome of Inappropriate Antidiuretic Hormone; P26
Synovial Fluid; RH4
Syphilis; D32, GY30, ID25, NP24
Syringomyelia; NS27
Syrinx; NS27
Systemic Arthritis; P92
Systemic Infections; ID21
Systemic Lupus Erythematosus; NP22, P94, R21, RH11
Systemic Toxicity; A21
Systolic Heart Failure; C41

T

Tachykinesia; N30
Talar Fracture; OR39
Tall Stature; P28
Tanner Staging; P31
Telogen Effluvium; D39
Temporal Arteritis; OP38, RH20
Temporal Bone Fractures; OT22
Tendons; PL3, PL23
Tension Pneumothorax; ER11
Testicular Appendix; U30
Testicular Torsion; U29
Testicular Tumours; U27
Tetanus; ID20
Tetralogy of Fallot; P19
Thalassemia; H19
Therapeutic Index; CP8
Thermal Injury; PL17
Thoracolumbar Spine; OR24
Thrombocytopenia; H7, P49
Thrombocytosis; H8
Thrombolytic Therapy; MI29
Thrombosis; VS4
Thrombotic Thrombocytopenic Purpura; H30
Thyroglossal Duct Cysts; OT34
Thyroid; E20
Thyroid Carcinoma; OT38
Thyroid Hormones; E20
Thyroid Imaging; MI26
Thyroiditis; E24
Thyroid Nodules; E29
Thyroid Storm; E25
Thyrotoxic Crisis; E25
Thyrotoxicosis; E22
Thyrotoxic Phase; E24
Tibia; OR37
Tibial Plateau Fracture; OR37
Tibial Shaft Fracture; OR37
Tic Disorders; N34
Tics; N30
Time-Course; CP6
Tinea; D28
Tinea Capitis; D28
Tinea Corporis; D28
Tinea Cruris; D28
Tinea Mannum; D28
Tinea Pedis; D28
Tinea Unguium; D28, FM44
Tinnitus; OT7, OT15
Tissue Grafts; PL12
Toddler's Diarrhea; P37
Toilet Training; P10
Tonometry; OP8
Tonsillectomy; OT43
Tonsillitis; P58
Topical Anesthetics; A22
Topical Steroids; D44
Topoisomerase Inhibitors; ID51
Torsion of Testicular Appendix; U30
Total Anomalous Pulmonary Venous Return; P20

Tourette's Syndrome; N35
Toxic Adenoma; E25
Toxic Epidermal Necrolysis; D23
Toxic Gaps; ER50
Toxic Megacolon; GS38
Toxic Multinodular Goitre; E25
Toxicology; ER49
Toxic Shock Syndrome; GY33, ID23
Toxoplasma gondii; ID39
Tracheal Intubation; A8, A30
Transient Synovitis of the Hip; P92
Transposition of the Great Arteries; P19
Transurethral (Foley) Catheters; U40
Transurethral Resection
Prostate; U42
Trauma
Bladder; U33
Renal; U32
Trauma- and Stressor-Related Disorders; PS18
Traumatic Injury; ER7
Traumatology; ER7
Traveller's Diarrhea; ID13
Travel Medicine; ID42
Trematodes; ID41
Tremor; N30
Trichiasis; OP13
Trichomonas vaginalis; ID37
Trichomoniasis; GY27
Tricuspid Regurgitation; C47
Tricuspid Stenosis; C47
Trigeminal Nerve; N11
Trigeminal Neuralgia; N44, NS39
Triglycerides; E3
Triplet Repeat Expansions; P41
Trisomy 13; P43
Trisomy 18; P43
Trisomy 21; P43
Trochlear Nerve; N11
Truncus Arteriosus; P20
Truth-Telling; ELOAM11
Trypanosoma cruzi; ID39
Tuberculosis; ID26
Tuberculous Polyserositis; ID26
Tuberous Sclerosis; U20
Tube Thoracostomy; GS16
Tubular Necrosis; NP26
Tubulointerstitial Disease; NP24
Tubulointerstitial Nephritis; NP24
Tumour
Penile; U28
Testicular; U27
Tumour Lysis Syndrome; H52
Tumours; NS10
Tuning Fork Tests; OT10
Turner Syndrome; P44
Twin Pregnancies; OB22
Twin-Twin Transfusion Syndrome; OB23
Tympanograms; OT11
Type I Error; PH14
Type II Error; PH14

U

Ulceration; G14
Ulcerative Colitis; G22, GS30
Ulcers; PL15
Ulnar Collateral Ligament; PL27
Ulna Shaft Fractures; OR19
Ultrasound; MI2
Umbilical Cord Prolapse; OB41
Uncomplicated Pyelonephritis; U12
Unconjugated Hyperbilirubinemia; P71
Upper Gastrointestinal Bleeding; G25
Upper Respiratory Tract Diseases; P87
Urea Concentration; NP5
Ureteropelvic Junction Obstruction; U37
Urethral Injuries; U33
Urethral Stricture; U8
Urethritis; U17
Urinalysis; NP5
Urinary Incontinence; GY38, U5
Urinary Retention; GS10, U6
Urinary Tract Infection; OB29, P63, U13

Urine Biochemistry; NP7
 Urine Microscopy; NP6
 Urological Imaging; MI16
 Urological Infections; U12
 Urticaria; D42
 Uterine Bleeding; GY6
 Uterine Inversion; OB46
 Uterine Rupture; OB41
 Uterine Sarcoma; GY40
 Uterus; GY2
 Uveal Tract; OP20
 Uveitis; OP20, OP29

V

Vaccine; P4
 Vacuum Extraction; OB43
 Vagina; GY2, GY48
 Vaginal Bleeding; ER40
 Vaginal Discharge; GY6
 Vaginal Exam; OB35
 Vagus Nerve; N13
 Valvular Disease; C46
 Varicella; P57
 Varicocele; U29
 Varicose Veins; VS9
 Vasa Previa; OB16
 Vascular Disease
 Anatomy; VS2
 Vascular Lesions; D9
 Vascular Malformations; D9, D10
 Vascular Neurocognitive Disorder; N27
 Vascular Tumours; D9
 Vasculitides; P94, RH17
 Vasculitis; RH18
 Large Vessel; RH20
 Medium Vessel; RH19
 Small Vessel; RH18
 Vasomotor Response; P76
 Vasomotor Rhinitis; OT25
 Vegetative State; NS34
 Venous Hum; P22
 Venous Insufficiency; 10
 Venous Thromboembolism; H35, OB31
 Venous Thrombosis; VS9
 Ventilation; A10
 Ventricular Septal Defect; P17
 Vernal Conjunctivitis; OP15

Vernix Caseosa; P76
 Verruca Palmaris; D31
 Verruca Planae; D31
 Verruca Plantaris; D31
 Verruca Vulgaris; D31
 Vertigo; OT12
 Vesicle; D5
 Vesicoureteral Reflux; U37
 Vesiculobullous Diseases; D20
 Vessels; PL23
 Vestibular Neuronitis; OT14
 Vestibular Schwannoma; NS13, OT15
 Vestibulocochlear Nerve; N12
 Viral Disease Patterns; ID4
 Viral Infections; D30
 Virology; ID4
 Visceral Organ Imaging; MI14
 Vision Loss; OP4
 Visual Acuity; OP5
 Visual Fields; OP6
 Vitamin B12 Deficiency; H24
 Vitamin K Deficiency; H32, P48, P49
 Vitiligo; D25
 Vitreous Detachment; OP22
 Vitreous Hemorrhage; OP22
 Vitritis; OP23
 Vocal Cord Nodules; OT29
 Vocal Cord Polyps; OT29
 Voiding; U5
 Voiding Cystourethrogram; MI17
 Volatile Inhalational Agents; A17
 Volvulus; GS37
 Vomiting; P33
 von Willebrand Disease; H30, P49
 V/Q Scan; MI27
 Vulnerable Populations; PH4
 Vulva; GY47
 Vulvovaginitis; GY26

W

Waldenström's Macroglobulinemia; H51
 Warts; D31
 Waste Excretion; NP2
 Water; PH22
 Contaminants; PH22
 Weakness; N9
 Wegener's Granulomatosis. *See* Granulomatosis with

Polyangiitis
 Wernicke-Korsakoff Syndrome; N36, PS25
 West Nile Virus; ID24
 Wheezing; P88
 White Blood Cells; H5
 Wilms' Tumour; P51, U38
 Wilson's Disease; G33
 Workplace Health; PH24
 Disease Prevention; PH24
 Legislation; PH24
 Promotion and Protection; PH24
 Rehabilitation; PH25
 Treatment; PH25
 Wounds; PL8
 Contaminated; PL9
 Delayed Primary Closure; PL9
 Dressings; PL11
 Infected; PL9
 Primary Closure; PL9
 Secondary Closure; PL9
 Spontaneous Healing; PL9
 Tertiary Closure; PL9
 Wound Healing; PL8
 Wrist; OR21

X

Xanthelasma; OP14
 X-Ray Imaging; MI2

Y

Yeast Infections; D32

Z

Zygomatic Fractures; PL32

TORONTO NOTES 2016

COMPLETE, CONCISE, AND UP-TO-DATE INFORMATION

For 32 years, Toronto Notes has been a premier study resource for the Canadian MCCQE and USMLE Step II medical licensing exams. This edition provides concise and comprehensive information on the objectives covered by these exams, including the most recent best practice guidelines and up-to-date trials for clinical practice. Toronto Notes is an excellent resource for clinical rotations and this text contains 30 subject-specific chapters:

Anesthesia and Perioperative Medicine
Cardiology and Cardiac Surgery
Clinical Pharmacology
Dermatology
Emergency Medicine
Endocrinology
Ethics, Legal, and Organizational Medicine
Family Medicine
Gastroenterology
General Surgery
Geriatric Medicine
Gynecology
Hematology
Infectious Diseases
Medical Imaging
Nephrology
Neurology
Neurosurgery
Obstetrics
Ophthalmology
Orthopedics
Otolaryngology
Pediatrics
Plastic Surgery
Population and Community Health
Psychiatry
Respirology
Rheumatology
Urology
Vascular Surgery
